PSYCHIATRY IN UNDERGRADUATE MEDICAL EDUCATION

WILLIAM MALAMUD, M.D.
Boston

During the last few years, and particularly following the experience gained in World War II, an important change has developed in the position occupied by psychiatry within the general medical profession, and with it has come the need for a reorientation of the program. On the one hand, psychiatry has begun to appreciate more fully the significant role that the somatic reactions play in influencing psychologic and social adjustment and their importance in the causation and treatment of personality problems. On the other hand, the medical profession in general has come to realize the effects that emotional and social factors exert on the somatic functions and the importance of these factors in the development and maintenance of physical symptoms.

Medical educators have long recognized this development and with it the need for a revision of the status of psychiatry in the training program of physicians, both at the undergraduate and postgraduate levels. It is not possible to discuss the entire subject in this presentation, since it would have to cover all the phases of medical education, such as premedical requirements, undergraduate medical teaching, training at the general intern and resident levels, postgraduate refresher courses, training of the psychiatric specialist, and, eventually, also the role that the medical educator should play in the training programs of the ancillary disciplines, such as nursing, social service work, clinical psychology and occupational and physical therapy.

In the present paper, I should like to limit myself to a discussion of the place that psychiatry should occupy in undergraduate medical education only, that is, through the conventional four years of medical school teaching. I do this, first, because there is the limitation of space; second, because I think that this particular stage of medical education is the most important as far as the subject is concerned. I base this statement on the assumption that the main goals of undergraduate medical education are to build the proper foundation for any future career in the profession and to prepare the student for the practice of clinical medicine. To function adequately in such a capacity, he must gain an understanding of the problems of personality adjustment, since he will have to deal with them in an admittedly large number of his patients whether their symptoms are predominantly physical or

not. Furthermore, it is true that the physician in general practice is the one who is most likely to see the earliest manifestations of what may eventually develop into the more serious psychiatric disturbances, and he will have the best opportunity of preventing them if he is properly prepared for the recognition and treatment of early danger signals.

IMPORTANCE OF PSYCHIATRY IN MEDICAL EDUCATION

I am fully aware of the fact that, when a representative of any medical specialty engages in a discussion of the place of his field in medical education, he is likely to see his particular specialty as the most important of all and is apt to overestimate the amount of time and effort that should be allotted to his department. I emphasize this particularly since the program I wish to present for your consideration may be regarded by some as perhaps too ambitious, and I should like to have it understood that I present it with a full appreciation of the psychologic blind spots of the specialist. If I were discussing psychiatry now simply as another specialty, I should most probably restrict such a program to considerably narrower limits. There are two features, however, that render the teaching of psychiatry definitely different from that of any other specialty.

In the first place, psychiatry occupies a unique position in its role as intermediary between the biologic sciences on the one hand and the social and psychologic sciences on the other. This uniqueness has a number of features in it, several of which have contributed to the somewhat facetious remarks that are frequently made about psychiatry. To me, however, the most fundamental of these features is the fact that, of all medical disciplines, psychiatry stands out as the one which both in practice and in theory cannot divorce itself from the ever present need of consideration of the person as a whole, functioning within his social setting. One can think of the lancing of a boil, the amputation of a limb or, even, the treatment of an infection or an injury as limited to some particular part of the body, but one cannot conceive of the evaluation or treatment of a delusion or a phobia without, at the same time, considering the whole person and all the psychologic and social implications. Similarly, one can study a nerve-muscle preparation as isolated from the animal or test a specimen of urine removed from its source, but one cannot study thought or feeling in vitro.

It is because of this, perhaps, that it has been so difficult to restrict the practice of psychiatry to physicians. Long after the obstetrician took the place of the midwife and the surgeon that of the barber, psychiatric disturbances were, and to some extent still are, considered as legitimately the object for investiga-

Read at the Forty-Fifth Annual Congress on Medical Education and Accreditation, Chicago, Feb. 7, 1949.
Professor of psychiatry and neurology, Boston University School of Medicine, and chief of psychiatric service, Massachusetts Memorial Hospitals.

tion and treatment by persons who are not physicians. But it is also because of this that the psychiatrist, from the dawn of psychiatric practice to the present, has consistently centered his work around the concept of the person functioning in his social and environmental setting. This view has rendered scientific progress in the field slow and difficult, but during the last few decades progress, even though gradual, has been consistent, and today psychiatrists possess a respectable fund of knowledge of scientifically valid and teachable concepts of the laws that govern human behavior, interpersonal relations and the effects of these on the adjustment of the individual person, be it psychologic or somatic.

Related to this is the second feature which has, particularly recently, gained in prominence in the field of medicine in general, namely, the fact that the proper understanding and adequate treatment of any illness must be based on the consideration of the patient as a whole. The importance of this concept has been pointed out so many times in the last few years that I am sure I do not have to elaborate on it here. The results of reliable scientific investigations, such as the work of Cannon and his followers,¹ and of the more contemporary studies on the role of emotions in influencing physiologic functions and dysfunctions, attest to the validity of this concept. This knowledge gained by the experimental investigator has helped to formulate in a systematic manner experience which the practicing physician has always utilized in his medical work. Practical experience substantiated by experimental investigation has demonstrated that this aspect of medicine is both essential and teachable. Medical educators of today have come to accept the fact that an adequate preparation of the physician must include the knowledge of human beings as they function in society, as is demonstrated, for example, by Allen's discussion of this subject.²

This leads to the following conclusions: 1. The medical student must, during his course in medicine, be trained to understand the nature and significance of personality functions and the influence that psychologic and social stress exert on his own total adjustment. 2. By tradition, interests and accumulated knowledge, the psychiatrist is in the proper position, at least for the time being, to teach the medical student these basic concepts.

It is because of these conclusions that, in outlining a program for the status psychiatry should assume in undergraduate medical education, I consider it of importance that such a program must not be limited to the teaching of psychiatry as a specialty, i. e., the training of the student in the ability to recognize, classify and, perhaps, treat the psychoses or even the psychoneuroses. Over and above that, psychiatry must play an important role in teaching the student the basic concepts of human nature at the same time the other basic subjects of anatomy, physiology and pathology are being taught. Furthermore, these concepts should be presented not as theoretic curiosities, nor as ideas entirely limited to use in the treatment of extreme deviations in psychologic function, but as laws applicable to human beings in general and to all their illnesses, be the manifestations psychologic or physical. It implies, too, that psychiatry in this sense must be taught at both the

preclinical and the clinical levels. With these considerations as a point of departure, I should like to present the outline of a psychiatric teaching program, with reference to its content, the relationship between it and the other courses in the medical curriculum, the time that should be allotted to it, the facilities which are essential for its implementation and the teaching personnel which would be able to carry it out.

BASIS FOR THE SUGGESTED PROGRAM

In the presentation of such a suggested program I shall, of course, have to undertake the blueprinting of what might be considered as an ideal plan. To a large extent, however, such plans are even at present being followed in several of the medical schools, although variations among individual programs do exist. I shall lean particularly heavily on the suggested program that was published last spring by the committee on medical education of the Group for Advancement of Psychiatry³ and, more specifically, on the program that is at present being established at the Boston University School of Medicine. The fact that such a program has been made practical shows that it can be carried out. At Boston University the plan is already beginning to show the results which it is hoped will follow the introduction of such methods in other medical schools.

Certain important principles must be considered as basic in the establishment of such a program. In the first place, and in keeping with what was stated in the beginning, the presentation of the subject at the undergraduate level should not be in the form of a separate course in the medical curriculum, it should be made clear to the students that they are being trained not to be psychiatrists, but to gain knowledge which is of importance in the understanding and treatment of all diseases. Obviously, at some time during this course the student will have to learn about psychiatric syndromes, their development and their management and treatment within the scope of general clinical medicine. This should be done, however, during the time allotted to other clinical subjects, and the student should be enabled to apply the basic psychiatric concepts which he learned in the preclinical years to the understanding of such syndromes as dementia precox or hysteria, in much the same way as they can be applied to any other medical disease.

The second principle follows the first and consists in the importance of coordinating the teaching of psychiatry throughout the medical curriculum with the teaching in the other departments, both preclinical and clinical. This, obviously, must be done in the teaching of any subject in medical school. No one will question, for instance, the importance of coordination of the teaching of anatomy with that of physiology, so that the student can correlate the two when he is called on to apply this knowledge to problems in clinical medicine. It is just as important to emphasize the interrelation between the preclinical teaching of psychiatry and that of any of the other basic subjects in medical science and the fact that this correlation must be carried over into the clinical years.

Third, since psychiatry deals primarily with the behavior of the person as a whole in his relationship to the social setting in which he lives, it is important that the student should be presented from the beginning with actual demonstrations of these functions as they manifest themselves in living human beings.

ORGANIZATION AND CONTENT OF THE PROGRAM

First Year.—The teaching of psychiatry should begin in the first year and, whatever the amount of time allotted per week may be, it should run through the entire academic year concurrent with instruction in the other basic sciences. It should consist of a systematic discussion of the structure, function and development of the personality in normal adjustment. The student should acquire an adequate working knowledge of the various components of the personality, such as behavior, intelligence, feelings, attitudes and emotions, in the same way as he will learn the somatic components in the course of anatomy. The main emphasis, however, should be placed on the interrelationships that exist among these components and the process of integration that characterizes all activities of the human being. He should be made aware of the fact that any apparently isolated act of behavior, psychologic or physical, is an expression of the organism working as a unit and is, therefore, dependent on other activities that are present at the time. He should be given a systematic understanding of the evolution of the personality from infancy, through childhood and adolescence, to maturity and the periods of involution and senescence. It should also be made clear to him that experiences in the past, whether they be consciously remembered or not, may affect behavior in the present and anticipations of the future. Finally, he must learn that the behavior of the individual person is closely integrated with and dependent on occurrences in the social and physical environment in which he lives. It is particularly important at this stage of the program to guard against the development of a cleavage between the so-called physical and psychologic manifestations of behavior. Coordination with the courses in anatomy and physiology should be more than simply temporal. Similarity in basic principles must be pointed out, as, for instance, the close resemblance of the mechanism of homeostasis with the equilibrium established between instinctive needs and social pressures.

It is obvious that this course should be given in the first year because that is when the student gets his basic concepts of the structure and the biologic functions of the normal person as they are presented in anatomy and physiology. But there is another reason for the desirability of teaching this material in the first year. The candidate for a medical degree comes to the school to learn how to treat human beings. In his premedical courses he should, and in most cases will, have learned a great deal about the general characteristics of human behavior and experience. He will have had them presented to him in his courses in biology, psychology, sociology and anthropology; he will have been made aware of the joys, the sorrows and the complexities of life in his courses in the humanities, and, finally, he will have been in contact with human beings all through his life. During the first two years the main goal of psychiatric teaching should be to preserve this concept of the unity of man that the student has brought with him when he entered medical school, so that, when he comes to his clinical studies, he will not have to face the problem of reintegration of the person whom by necessity he had to study in parts in most of his earlier work. To accomplish this, it will be important to demonstrate the existence of these functions and their mechanisms in actual persons, the variations as they occur within normal limits and the comparatively milder deviations as they are encountered on the wards of a general

hospital. He should also learn about his own attitudes and reactions and come to understand some of the factors which influence him in their development.

Second Year.—In the second year, when the student begins to extend his knowledge of normal variations to the study of the pathologic changes in the structure and functions of the body and the methods of examination and evaluation of these, the course in psychiatry should start with a presentation of the general concepts of psychopathology. The student should be made aware of the deviations from average behavior and the problems which they introduce, the manner in which such deviations are developed, the factors that influence them and the effects they have on adjustment. Care should be taken to discuss these not in terms of specific syndromes but rather as fundamental reaction types. The principle to be followed is the same as in general pathology, in which one starts with the presentation of general tissue reactions, such as inflammation. In psychopathology, therefore, one should start with a discussion of the nature and development of such general reactions as anxiety, pain, guilt and defense mechanisms, like repression, conversions, phobias or projections. The close interaction that exists in the so-called somatic and psychologic manifestations should be emphasized. The student should learn the basic principles of the effects of somatic dysfunctions, such as disturbed metabolism, on the function of the individual person as a member of society. At the same time, he should be made aware of the effects of psychologic functions on the various organ systems. A major portion of the course in the second year should be taken up with systematic and, if possible, individualized instruction in the all-important technic of interview and the management of the personal interrelationships of the physician and patient. To some extent, this will have been started even in the first year, if the method of presentation of human beings to the student was adopted. Whereas in the first year the student may have to be restricted to observing the instructor as he interviews a patient, in the second year the importance of following certain technics and rules in this function should be systematically presented. Here, too, and perhaps even more than in the first year, coordination with other fields should be stressed. Psychopathology should be closely integrated with pathologic physiology. Psychiatric examination and observation should be made an integral part of general physical and medical examination. Finally, the methods of obtaining historical data and their value should be taught in close coordination with the similar area of instruction in other departments.

Third Year.—In the third year the instruction should move on to the discussion of actual disease syndromes, their causation and development and the practical methods of treatment and management. It is here, of course, that the student should also be taught to recognize and treat the specific mental diseases. For that purpose, it will be important to utilize material primarily of psychoneurotic type, together with some of the more frequently encountered psychotic reactions. A major portion of the third year course, however, should consist in the teaching of personality factors in general medical disease. These should include not only the effects of emotional stress on the body organs but also the effects of physical illness on psychologic function. The organic syndromes, such as systemic infections and central nervous system diseases which may produce direct manifestations in terms of delirium, con-

fusion and character changes, should form a part of such instruction, but it is even more important to point out the indirect effects of physical illness, their meaning in terms of danger, the anxieties that develop and the tensions that follow them. The student should learn how to evaluate the historical factors in the life of the person as they may influence the severity of these reactions and how to utilize this knowledge in the management of such diseases in their impact on the personality.

It is quite obvious that teaching of this type in the third year can best be carried out in direct work with patients. Facilities must be provided for the presentation of the more serious personality disturbances as they are found either in mental hospitals or in psychiatric wards of a general hospital. But the major portion of the teaching in the third year should take place on the wards of the general hospital with medical, surgical and pediatric patients. It is in this way that the student will be prepared to deal with the everyday problems that he will see in his practice and be able to treat them not in the capacity of a psychiatrist but within the framework of comprehensive medicine.

Fourth Year.—In the fourth year the student should be given an opportunity to apply the knowledge that he has acquired during the first three years in more or less independent work with patients, preferably in an outpatient department. Such a department again should be part of a general hospital where the student will have the opportunity to deal with the general run of patients that he will probably see in his own office. Although this part of instruction will be undertaken by psychiatrists, it should be carried out in a setting which will enable the student to utilize psychiatric knowledge as it applies to general medical practice. Here more than in any part of his course he will have to be closely supervised by an adequate staff of instructors, but within that framework the student ought to be given an opportunity to carry out both evaluation and treatment personally and to learn the importance of establishing the proper interpersonal relationship with his patients. At this stage the student must be given an opportunity to gain firsthand experience in the simpler methods of psychotherapy. It is not necessary, in fact, it is probably inadvisable, to stress the more complex and intensive methods as they are used by specialists in psychiatry, although the student should be made aware of them. The student can, however, be taught systematically the use of the procedures that have recently been formulated under the term "brief psychotherapy." The range of the material will depend on the facilities available. If the instruction is given in the outpatient department of a large general hospital, however, the material will obviously include most of the problems that are seen in general practice: the everyday medical and surgical conditions, diseases of children and of the aged and genitourinary and gynecologic problems. Finally, the teaching in the fourth year must serve as a link between the psychiatric instruction in the undergraduate program and that which will be provided in the internship to follow.

TIME ALLOTMENT FOR TRAINING IN PSYCHIATRY

No mention has been made so far as to the amount of time that should be allotted to the teaching of psychiatry throughout the four years. Let me emphasize here that, although I consider a certain minimum of time as an important requisite, the actual amount of it is not quite as important as the manner in which

it is utilized. The psychiatric teaching staff should never take on more time than the members can profitably use. This will obviously depend on (a) how much actual knowledge the staff can contribute and (b) the number of instructors available. In general, instruction should be carried on throughout the entire first year so as to assure coordination with the other preclinical subjects. This means that it will be necessary to have at least one hour a week through the entire year. A similar minimum of time should also be allotted to the second year teaching. It must be added, however, that the part of the second year program during which the student will be instructed in interview technic, history taking and examination can be most adequately carried out with small groups of students rather than with the entire class at the same time. The student must be given an opportunity to interview and examine the patients under the supervision of the instructor, and this can best be done with small groups. The amount of time for the class could remain the same, but the feasibility of breaking the class up into groups and giving each group the same amount of time will depend on the number of instructors available. In terms of curricular hours, therefore, a minimum of thirty-two hours for each of the first two years should be allotted to the subject.

In the third year, in which work with patients on the ward is essential, obviously the amount of time, too, should be increased, and as much of the teaching as possible should be carried out on the basis of close relationship between the instructor and students. Finally, in the fourth year the principle of assigning the student for a given period, perhaps four weeks, to the subject of psychiatry should be followed and this block of time should be allotted to alternating small groups of students. It is especially desirable to have each student assigned to an instructor who knows the patients that the student is working with and who is able to supervise the work adequately. This means that a minimum of about two hundred and fifty hours will be required for the third and fourth years. In the clinical years, the coordination with other departments becomes particularly important so as to give the student an opportunity to integrate his psychiatric experience with that he will gain in general medicine and surgery. If possible, particularly in the third year, some of the psychiatric teaching should be made part of other courses. The demonstration, for instance, of the pathologic effects of emotional tension on the gastrointestinal system, would be most effective if it was presented as part of a course during which other phases of diseases of the gastrointestinal system are considered.

METHODS OF TEACHING AND TEACHERS

The methods of teaching will, of course, vary with such factors as the number of instructors available, the amount of time in the curriculum and the particular characteristics of a given teacher. In general, demonstration and seminar forms of teaching are more effective than formal lectures. This does not mean that lectures should be altogether deleted. Certain fundamental principles and dynamics of human behavior can perhaps best be described in a lecture, if it is well systematized and, particularly, if it is supported by brief presentations of cases. However, some instructors are much more effective at bedside teaching than in presenting a formal lecture. Obviously, in the third and fourth years lectures should gradually give way to work on the wards, and the formal contact between

the lecturer and class should be superseded by individual contact between instructor and student.

An important factor in organizing such a program and in carrying it out consists, of course, in the selection of the proper teaching personnel. Ability to teach, that is, to establish proper rapport with the student and to convey knowledge clearly and convincingly, is as important here as in any other field. In addition to that, an instructor in psychiatry should by preference be a good practical psychiatrist whose skill in psychotherapy would materially enhance his success as a teacher. He should have adequate training in the general basic sciences and the clinical subjects with which he is to coordinate his psychiatric teaching. A vital interest in his own field is essential, but not to the point of the development of blind spots for the importance of other fields of medicine. He should be able to choose, and be given the opportunity to use, the method of teaching which is most compatible, not only with the particular phase of the subject which he teaches but also with his own capacities. Some will do best as lecturers, others as clinical instructors. The teaching in the preclinical years, but particularly the first one, at present at least, has to be done by the members of the general staff of the psychiatric department. It must be admitted that frequently such an instructor, who is probably an excellent psychiatrist and well suited for teaching clinical psychiatry, may not be qualified by either his training or his particular personality to teach the basic concepts of human nature. If, in addition to this, the scarcity of good psychiatric teachers in general is considered, the possibility of utilizing adequately trained clinical psychologists for this phase of teaching should be given attention, and in some schools this policy is actually being followed. At present, however, it seems that the important thing is to teach the preclinical phases of psychiatry with a view toward their applicability to medical practice, and this could probably be most adequately accomplished by a psychiatrist who, in addition to his clinical insight and training, possesses the skill to organize and teach the general concepts basic to such a course.

OTHER CONSIDERATIONS

In the present discussion I have restricted myself entirely to the role that the psychiatrists should assume in a program for undergraduate training in psychiatry. No attempt was made to describe the degree of participation by representatives of other departments, a factor which is obviously important if real coordination is to be achieved. This includes the staffs of the other preclinical departments and, in the clinical years, of the departments of medicine, pediatrics, surgery and preventive medicine, as well as those of the specialties. This should also include the group of disciplines which, during recent years, has become so important in carrying out the "clinic team" program in dealing with personality problems. Of particular value in the undergraduate medical program are the psychiatric social worker, the clinical psychologist and the psychiatric nurse. The vast amount of knowledge that has been made available by these workers and the valuable techniques that they have developed in the understanding of the significance of social stress, the measurement of personality functions and the treatment and management of patients are of great importance in the practical work with such problems. The student should be made aware of these and of their application in the field of medicine, although no attempt should or could be made to develop these skills in him.

CONCLUSION

The main purpose of this presentation was merely to indicate the general trends that such a program for undergraduate education should follow rather than to offer a fixed and generally applicable plan. A number of conditions, such as the type of personnel, the time that can be allotted and the facilities available, are apt to show such wide variation that the details of the program will have to be worked out on an individual basis. Whatever these variations may be, however, the main goal must remain the same. The student should be given a workable, systematic knowledge of the basic facts of human nature and must learn how to apply them in the prevention and treatment of diseases.

MEDICAL EDUCATION IN PROGRAMS OF THE PUBLIC HEALTH SERVICE

LEONARD A. SCHEELE, M.D.
Surgeon General, United States Public Health Service
Washington, D.C.

A broad concept of medical education is essential in the present era. For the purposes of my discussion, I have taken medical education to include the basic and postgraduate training of the major professional groups concerned with the health care of the people.

The medical school is recognized as the indispensable, integrating force of the medical center of the future. The medical center, as we visualize it, would be the hub of continuous research and education, as well as of medical and public health services to outlying areas.

The contemporary problems of medical education are matters of public concern. In 1946 Dr. H. G. Weiskotten stated:¹

The first and most important step to be taken in improving the health and medical care of the American public is to see to it that medical schools are provided with sufficient funds to conduct a basically satisfactory program of medical education.

Since that time, the financial difficulties of many medical educational institutions have increased. Official and nonofficial agencies have become as concerned as medical educators and university officials that satisfactory solutions be found promptly.

All of us realize, too, that the problem of medical education is only part of a larger whole. The total structure of higher education in the United States has suffered unprecedented strains during the past decade. There is no doubt that the larger problem must be solved if we are to maintain our tradition of full educational opportunity for all. Medical education is so closely related to the conservation of man power—a vital concern to the nation—that it would seem unwise to delay much longer in meeting its urgent needs.

The Public Health Service has a dual interest in medical education. As a consumer, we draw on the professional schools to staff our medical and hospital programs, our research activities and our programs of preventive medicine and public health. As an investor, we provide grant-in-aid funds to improve national health through the work of organizations outside the federal government. Specifically, we provide grants to expand medical research, state and local health services and hospital facilities. Through financial and other assistance, we seek to increase the supply of well

Read at the Forty-Fifth Annual Congress on Medical Education and Licensure, Chicago, Feb. 7, 1949.

1. Weiskotten, H. G.: Financial Support of Medical Education, J. A. Am. M. Coll. 22: 1-4 (Jan.) 1947.

trained research scientists, public health personnel and clinicians in special fields.

As medical educators, you are especially interested in the role of the Public Health Service as an investor in medical education. The programs of the Public Health Service in aid to medical education and research have been developed in close cooperation with the medical schools, and mutually satisfactory principles have been applied to their administration. Let me, then, review briefly certain of the common characteristics, objectives and principles of our programs related to medical education.

POLICIES OF PUBLIC HEALTH SERVICE

The policies of the Public Health Service in aiding educational and research institutions that have emerged during the past twelve years have been based on our long-standing policies of cooperation with state and local agencies and medical institutions.

The National Cancer Act of 1937 established the pattern of aid to institutions for research, to individuals for research training and to clinicians for postgraduate training. The Public Health Service Act of 1944 broadened our authority for grants and fellowships for research to cover the entire health field.

In 1946, the National Mental Health Act authorized a program similar to that of the National Cancer Institute, with provision for grants to teaching institutions to improve their psychiatric training programs. In 1947, the National Cancer Institute was provided funds for teaching grants to medical and dental schools to improve undergraduate teaching of cancer. In 1947, Congress authorized construction grants for cancer research facilities. In 1948, the National Heart Act and the National Dental Research Act authorized programs parallel to the cancer program.

NATIONAL ADVISORY COUNCILS

National advisory councils, each established by law, play an important role in the administration of our research and training programs. The councils are composed of leaders in the various medical and dental specialties, in basic and clinical research, social science research, public health administration and education. The law specifies that the National Advisory Heart Council and the National Dental Research Council include leaders in public affairs. At present, the National Advisory Health Council deals with research and training in general medical sciences, whereas the special councils deal with the programs in cancer, cardiovascular diseases, mental health and dental research.

The problems faced by the several councils require special policies to meet special needs. However, certain basic policies characterize all of these programs. Academic freedom for the institutions and individuals receiving grants is a primary consideration. The intent of Congress, the recommendations of our councils and the traditions and experience of the Public Health Service insure maximum safeguards for that freedom. Every effort is made to insure the widest distribution of funds, taking into account the quantity and quality of the projects and the available resources.

FIVE TYPES OF AID

The programs of the Public Health Service give both direct and indirect aid to medical education. In certain programs, direct aid has been provided by teaching and construction grants to institutions. Less direct but significant support is available through research

grants, fellowships and traineeships. Five types of aid are thus available through the Public Health Service.

1. Teaching grants are authorized to initiate, expand or improve teaching in selected fields; namely, cancer, cardiovascular diseases, psychiatry and oral diseases. Teaching grants for cancer are available to medical and dental schools. Grants to individual schools are limited to \$25,000 per year to four year medical schools and \$5,000 to dental schools and two year medical schools.

2. Construction grants are authorized to assist institutions in providing more adequate facilities for laboratory and clinical research in cancer and cardiology. This form of assistance became available for cancer research in July 1947. It is hoped that funds will become available to assist in construction in the cardiovascular research fields next July.

3. Research grants are available throughout the whole range of medical and related sciences, with special funds earmarked for cancer, cardiovascular diseases, psychiatry, peptic ulcer research and dental research. The objective of these programs is to supplement support provided by other public and private resources and to stimulate research in neglected fields. During the fiscal year ended last June 30, the Public Health Service expended \$8,108,160 in research grants, covering seven hundred and ninety-five projects in the general, mental health and cancer fields. These projects were located in one hundred and ninety-eight institutions, in thirty-seven states, two territories and five foreign countries.

4. Research fellowships are awarded to qualified applicants for training in general research and in each of our specialized programs. During the three fiscal years 1946 to 1949, approximately six hundred fellowships have been awarded. The recipients have taken their training in sixty-six institutions of their own choosing.

5. Traineeships were first established to increase the number of clinical specialists in cancer. In the field of mental health, the training program has been expanded to include the training of psychologists, psychiatric social workers and psychiatric nurses. When the programs in cardiovascular diseases and oral diseases are implemented by appropriations for those purposes, traineeships will be available in these fields.

During the current fiscal year, ending June 30, 1949, the Public Health Service has had available a total of \$24,427,000 for these five types of aid to research and education. About \$11,000,000 has been invested in research grants; \$8,000,000 in construction grants; \$3,000,000 in fellowships and traineeships, and a little over \$2,250,000 for teaching grants. Approximately 84 per cent of the total funds available for research and training through the Public Health Service have gone to medical teaching institutions.

The foregoing summary of the research and educational activities of the Public Health Service shows that a large program has developed in those fields since the war. Through one or more of the five types of aid, almost every medical school and graduate school of public health is participating. The majority of dental schools, many related departments of universities, nursing schools and affiliated hospitals are receiving some form of assistance.

The development of the over-all program has been complicated by the allocation of funds to specific diseases or areas of study. The magnitude of such prob-

lems as cancer, mental disease and heart disease has properly captured the interest of the public; as a result, both public and private funds for research and training in these categories have increased enormously.

While these so-called categorical programs have been developing, the general financial problems of many medical and related schools have increased. The impact of Public Health Service grants for research and training in the light of increased costs of medical education has led to recognition that an evaluation of our programs must be made in order that sound policies of federal assistance may be formulated.

EVALUATING EFFECT OF GRANTS

The National Advisory Health Council at its meeting on Oct. 23, 1948, passed the following resolution:

Moved. That the Council approve a study of the Public Health Service programs of Research and Educational Grants and Fellowships and of the costs of medical education and also assemble data as to the breakdown of the cost of medical education, including that of hospital teaching beds, with a view to evaluating the effect of such research and educational grants on medical school finances and on medical education. The effect of such subsidies on national thinking must also be considered. One of the chief purposes of this study is to determine whether present Public Health Service programs or other methods may be recommended for the improvement and extension of medical education. For this purpose it is recommended that an ad hoc committee be appointed by the Surgeon General of the Public Health Service to include representatives of this and other Councils and such other persons as the Surgeon General may designate.

Since that time, the Public Health Service has held a series of conferences with the Committee on the Survey of Medical Education sponsored by the Association of American Medical Colleges and Council on Medical Education and Hospitals of the American Medical Association. The ad hoc committee has been appointed,² and it will work closely with the Committee on the Survey of Medical Education to develop a cooperative study the findings of which will be made available to both committees.

The objectives of the study will be to assemble the facts necessary for an evaluation of the programs of the Public Health Service. Such an appraisal is necessary as a basis for further planning, direction and administration of our programs.

The joint committees and the technical staffs of the Public Health Service and the Committee on the Survey of Medical Education are conferring during this Congress. By the end of the week, we hope that final decisions will have been made as to timing, methods and other factors in the conduct of the study. It is hoped, however, that no time will be lost and that the field work can begin immediately after the conference. If this can be done it is probable that a preliminary report will be available by June 1949.

The Public Health Service is deeply gratified at the cooperation extended to us in this project by the Committee on the Survey of Medical Education and its sponsors. I feel sure that a joint endeavor of this kind will yield fruitful returns, not only in the practical results of the study, but also in the development of close working relationships between our organization and the nation's medical schools.

You as medical educators and we as public health administrators are, in a broad sense, public servants

working toward common objectives. Close cooperation of this sort will make our tasks easier and will insure the best returns on the large investments for the people's health.

In our conferences with educators and others, and in our studies of the problem through the range of medical education, it has become evident that the professional schools are in need of more adequate financing. These discussions have led us to certain basic conclusions which should be invaluable in the development of future programs.

CONCLUSIONS

The financial problems of medical education vary, not only between the specific professions but among institutions in the same profession. We believe that more workers in all medical fields are urgently needed. Aid should have a dual objective. It should support and improve the base of present medical education and provide for increasing the supplies of personnel. In order to step up student output new schools should be established and enrolment should be increased in existing schools where expansion will not impair present standards of education. Institutions receiving aid should be accredited by acceptable professional bodies.

Advisory councils—possibly an assembly of all deans—should function in helping to guide a program of general aid to medical education. In the event that federal aid is added to any new voluntary aid program that may be organized, such an advisory group would assure wise use of federal funds and would safeguard the academic independence of teaching institutions.

I believe that federal aid is desirable and that it can be given without causing deterioration in teaching standards or loss of independence by the professional schools. A reasonable time limit should be placed on any federal aid program, with a requirement to study and periodically report on the effectiveness and usefulness of the program. Nondiscrimination should be adopted as a broad general policy, to insure an equal opportunity to all qualified students without regard to race or sex, creed or color.

On the basis of such principles, it would seem that a broad program of federal aid to medical education could be developed which would be mutually satisfying to the schools, the professions and the public. It is a matter of urgent concern that the schools which produce the nation's physicians, dentists and other essential personnel be assured continued vitality, growing usefulness and greater opportunities to impress their high standards on professional practice in our own country and in others.

Should a broad program of federal aid for medical education be authorized, the Public Health Service hopes to play as acceptable a role in its administration as we now play in aid to research and special fields of training. That is to say, we would expect to act as financial partner, co-worker and consultant. The principle of cooperation, without control or regimentation, would apply as it has in our long-standing activities with state and local agencies, private organizations and the professions. These are the aims and policies of the Public Health Service and our parent organization, the Federal Security Agency.

As a physician and an administrator of varied programs in medical research, clinical practice, public health and preventive medicine, I feel that the professions must keep medical education a living force—capable of change and adaptation to new times and environments.

2. The ad hoc committee is composed of twelve members; they are representatives of the advisory councils of the Public Health Service and other experts in medical education.

The educational needs of physicians, dentists and nurses—whether in public or private institutions or in private practice—shift with the changing needs of humanity and the forward thrust of medical knowledge. In our basic courses of training, we need better preparation in psychiatry, preventive medicine and the social and administrative aspects of medical service. Particularly urgent is the need for stimulating undergraduate students in medicine and dentistry to enter the field of scientific research as a career.

Throughout the whole range of undergraduate, graduate and postgraduate study, we need to develop a progressive attitude about prevention and rehabilitation. At every step in our study of the patient or the community we should be alert to the possibilities of preventing disease or its serious consequences. We should be alert to the possibilities of restoring the patient to maximum physical, mental and vocational function.

Above all, the professions must preserve an attitude of scientific skepticism toward existing methods and technics for the health care of the people. From skepticism springs the drive to find the answers to perplexing problems, leading to the ultimate goal of medicine—prevention. Recent developments in some of the medical training centers of the nation are prophetic of the future alliance of education, research, medical service and public health. The interplay and stimulus of these several forces can but result, eventually, in higher levels of national health.

THE ESTABLISHMENT OF NEW MEDICAL SCHOOLS

H. G. WEISKOTTEN, M.D.

Chairman, Council on Medical Education and Hospitals,
American Medical Association
Syracuse, N. Y.

During the past few years the need for more adequate support of medical education has been repeatedly emphasized. At the last meeting of this congress, President Valentine of the University of Rochester designated the situation as a crisis. Later, last spring, Dr. Leonard Scheele in his inaugural address as Surgeon General, United States Public Health Service, said:

The crisis in the professional schools of the Nation is the most serious problem which faces the medical and health professions today. Unless or until the crisis is resolved, the nation will be hampered in all its efforts to increase its health resources and to improve the health of the people.

It has been a natural consequence of the development of high standards of medical education that medical schools have greatly increased their responsibilities and their influence. Medical school teaching and research programs, when integrated into the activities of hospitals, outpatient clinics and health and medical care programs, have so improved these activities and programs that they have become essential to their full success.

Recognition of the contributions of medical schools to these programs is indicated by the fact that practically every new program in the field of health and medical care is planned to center about medical schools. At the same time an increasing amount of research essential to the advancement of medicine is being channeled into and through the schools by federal agencies,

industry and private foundations. The development of the Federal Hospital Construction Program will place ever increasing responsibilities on the medical schools, as will also the proposed expansion of public health programs. Hence, there appears to be no possibility of any retrenchment in the activities and responsibilities of the medical schools of this country. On the other hand, there is every indication that the responsibilities and financial needs will continue to increase as they broaden their contributions to the improved health and medical care of the public.

It is not my purpose at this time to justify the high cost of medical education. I propose rather to point out that the present so-called crisis in medical education involves far more than the mere financial support of existing medical schools, which I believe will in some manner be provided. It involves programs which may influence the high standards of medical education and medical care which have already been achieved.

Paradoxical as it may appear in the face of the present plight of the existing medical schools, there is developing a demand that these schools greatly increase the sizes of their student bodies and that new schools be established. This is due to several factors. There are many indications that there is need for an increased number of physicians, although it is likely that this need has at times been greatly exaggerated. It is also obvious that there has developed, not alone an increased demand for opportunities to study medicine, but also an increased number of well prepared applicants for admission to the medical schools of the country.

Furthermore, many medical schools have adopted rather rigid geographic limitations in their acceptances. Practically all of the state and city-supported medical schools (28 of the 71 four year schools), and some of the privately supported schools are limiting their acceptances more and more to residents of the state or locality in which they are situated. The apparent need for opportunities for the youth of the states not having medical schools to undertake the study of medicine is creating a demand that new medical schools be established in these states.

The Federal Hospital Construction Program, involving the development of medical centers together with the recognition of the need for an affiliation of such centers with medical schools, has furnished an added stimulus for the development of medical schools in these states. Still another factor influencing this trend is the recognition of the contributions which medical schools can make to all of the health and medical care programs of the area in which they are located. Finally, the prospect of federal support for medical schools has proved an added incentive for the development of new schools. Five states are now in various stages in the development of new medical schools. At least three additional states are seriously considering the development of new schools in connection with their state universities.

The development of new medical schools is a serious business. There are many factors which are essential to the development of satisfactory programs of medical education. In some instances all of these are receiving careful study in sound programs for the development of new schools. In other cases, far too little attention to many of these factors may seriously handicap the schools in the development and maintenance of high standards of education and in meeting their full responsibilities to medical education and to the American public. The fact that the proposed new schools would

be developed as a part of the educational systems of their respective states makes the problem a far more serious one than would be the case if they were developed under private auspices. This is because it would be extremely difficult for a state licensing board to refuse accreditation to a medical school conducted by its own state university, although it might fail to meet the approval of unofficial national accrediting bodies.

In view of these present trends, it is probably worth while to discuss briefly the various factors involved in the satisfactory development of a new medical school and the establishment of sound educational, research and service programs. Although all of these factors are so interrelated that it is difficult to discuss them separately, brief comments in regard to them may be worth while in emphasizing their importance and interrelationships.

FINANCIAL SUPPORT

Three years ago I estimated the essential basic minimum required as the annual budget for a well established medical school with not more than fifty students in a class, located in a community which had available competent and interested volunteer clinical teachers, to be between \$315,000 and \$415,000. I realized at that time that my estimate was low, although it was higher than the budgets of many of the medical schools in this category. Today that estimate is as much out of date as the old ten cent loaf of bread. The amount required for the annual budget will vary greatly in different schools. Likewise the amount required for construction will vary greatly, depending on a variety of circumstances. No new medical school should be established without first being assured of adequate funds for its full development and its continued support.

SPONSORSHIP AND ORGANIZATION

Sound educational sponsorship comparable to that of a well established university is essential if there is to be assurance of the stability of a newly developed medical school. At the same time, the medical school should be organized as a closely integrated unit without unwarranted responsibilities in connection with any other educational programs. It should also be organized to provide ample opportunity for autonomous development and for continuous study and experimentation in the conduct of its activities.

FACULTY

The development and maintenance of medical school faculties is one of the most serious problems facing the medical schools today. The problem is only in part a financial one. There simply is not a sufficient number of competent and well trained men to fill the required positions in the existing medical schools. This is especially true in the basic science departments. Newly developed medical schools with sufficient funds may secure faculty members by "raiding" existing schools for men now essential to the programs of those schools. This contributes little to medical education on a national basis. More adequate financial support of medical schools and increased opportunities for research will offer more attractive careers in the basic sciences and attract more graduates to them.

Competent clinical faculty members, although less scarce, are frequently more difficult to move from schools and communities in which they have become established. The mere presence of competent and interested practitioners in a community in which it is

proposed to develop a new medical school is not in itself assurance that the school can readily develop a competent clinical faculty. On the other hand, the absence of such competent clinicians in the community means that the school must necessarily build its clinical faculty entirely from outside sources. In any circumstances, the school must have a considerable number of its faculty in the major clinical departments serving on an academic basis if it is to maintain satisfactory standards. It must also have available for teaching a considerable group of competent physicians in the more narrow clinical specialties. No newly developed medical school will have readily available the competent, experienced and interested clinical teachers which many of the existing schools have developed over a period of many years.

INDEPENDENCE

Given a competent faculty, a school must be independent of any domination or coercion in the development of its teaching and research programs as long as satisfactory standards of medical education are maintained. These programs will differ in various schools, depending on a variety of factors. The great progress which has been made in medical education in this country has been due in a large measure to the independence of schools in developing their own teaching and research programs.

CLINICAL FACILITIES

The mere fact that more than half of the undergraduate programs of medical schools are today carried on in hospitals and outpatient clinics is evidence of the important place of clinical facilities in the development of a school. Practically all of the graduate programs and postgraduate refresher courses are conducted in hospitals. Hence, one of the most important features of a program for the development of a new medical school is the availability of clinical facilities which are not alone adequate in both quantity and quality but are definitely under the control of the school so that they may be fully available for both teaching and research.

LOCATION

The unsatisfactory location of a medical school may for all time handicap it in its teaching, research and service programs. The number and variety of clinical cases both on the hospital wards and in the outpatient clinics which are essential for a satisfactory program of clinical teaching and research may depend in a large measure on the location of the school. In general, it is extremely difficult to provide adequate hospital and outpatient material for satisfactory clinical instruction in a community of less than 200,000 population. The availability of the competent teachers in all of the various specialties of medicine which are essential to the conduct of a well rounded teaching, research and service program may also depend on the size and nature of the community in which the school is located. Consideration should also be given to the location in which the school can most effectively render its contribution to the health and medical care programs of the section of the country that it will be called on to serve.

The ideal location for a medical school is on a general university campus in intimate relationship with the other colleges of a large university if at the same time the school can have readily available all of the other essential personnel and facilities required for

its teaching and research programs. Such a location permits a medical school to broaden more readily its activities and responsibilities in both teaching and research. However, in these circumstances it is especially important to emphasize that the medical school should be organized as a closely integrated unit without unwarranted responsibilities for other educational programs.

LEADERSHIP

Either in its dean, with its faculty or in the faculty itself, the school must have sound, intelligent, effective leadership which views the school as an integrated whole in regard to its educational and research programs, its relationships to hospitals and outpatient clinics and to all health and medical programs of the area in which it is located, as well as its place in the nation as a whole.

COMMUNITY COOPERATION

Without the full cooperation of the medical, health, social and welfare agencies of the community in which it is located, a medical school may be greatly handicapped in providing a satisfactory educational program and in its continued support and development. A medical school has much to offer such agencies in terms of high standards of service. At the same time the service programs of the community agencies, both public and private, may offer unusual opportunities for both teaching and research. Although the over-all benefits of such cooperation are becoming more generally recognized, it is important that a newly developing medical school give attention to such available community agencies and seek their cooperation and support from the very beginning. Several schools which in the past have failed to do this have functioned under serious handicaps for a number of years before they have been able to convince the community agencies of the mutual advantages of cooperation in the conduct of their programs.

PHYSICAL PLANT

Just as industry has learned that efficiency in the operation of its plants depends in large measure on sound planning and construction, so medical schools have learned that the efficient functioning of a school as an integrated whole, operating in satisfactory relationship with all of the programs in which it participates, requires sound physical planning. An official of a well known and long-established medical school which has developed its various laboratories and clinical departments in separate buildings recently stated that the faculty of this school had even considered the advisability of abandoning their entire plant and starting over again in the development of a well integrated physical plant.

The wisdom of appointing major department heads sufficiently early in the development of a new medical school to permit them to plan the construction of their departments has been demonstrated in the development of several schools. The important features to keep in mind in the construction of a new medical school include efficiency, simplicity, flexibility and expandability, together with proper physical relationships between basic science and clinical departments in their teaching, research and service programs. In this connection it is important to realize that nothing will cement the relationships of the various units of a medical school's development quite like cement. Furthermore, nothing will prevent barriers between departments quite like eliminating them in construction plans.

I have briefly indicated these various factors which are involved in the development of sound programs of medical education in the hope that they may stimulate careful study and planning on the part of those who contemplate the development of new medical schools.

The Council on Medical Education and Hospitals of the American Medical Association, working in cooperation with the Association of American Medical Colleges, is anxious to be of assistance to any responsible groups which may contemplate the development of new medical schools.

It is hoped that the survey of medical education now being initiated by the Council on Medical Education and Hospitals and the Association of American Medical Colleges will provide intelligent guidance for the future development of medical education in all of its various relationships to the improvement of the health and medical care of the American public.

LICENSING OF FOREIGN MEDICAL GRADUATES IN THE UNITED STATES

CREIGHTON BARKER, M.D.
and
GRACE MOONEY, Ph.D.
New Haven, Conn.

The licensing of graduates of European and other foreign medical schools, except those in Canada, has been a matter of grave concern to examining boards in a majority of our states for the last ten or a dozen years. Prior to that time, the number of graduates of foreign schools seeking settlement in this country was small, and often the candidates were of such unusual attainment that their coming here presented little question. However, coincidental with political changes in central Europe during the thirties, a substantial number of émigré physicians sought refuge in America, and licensing boards were faced with a new and complicated problem. At about the same time many American students went to Europe for medical education and returned here to practice. The Council on Medical Education of the American Medical Association has reported that from 1930 through 1947, 14,520 graduates of foreign schools, not including Canadian, were examined by boards in the United States. Of these, 7,547 passed; there was a failure rate of 48 per cent. The largest number, 2,088, was examined in 1940.

The two groups, that is, the émigré and the foreign educated American, met with somewhat different reactions on the part of boards. On the one hand were aliens seeking refuge in a new country; they knew little of the standards of medical practice here, and in many states they were completely barred. On the other hand were natives who had obtained their education abroad, and the same objections could scarcely be raised about them. But underlying both types of reaction was the question of the quality of medical education the graduates had received. The Council on Medical Education does not grade medical schools outside the United States and Canada, and information concerning most foreign schools is inadequate. In an earlier day, a few were well known to American physicians who did postgraduate work in them, but the years have

Read in a panel discussion at the Forty-Fifth Annual Congress on Medical Education and Licensure, Chicago, Feb. 8, 1949.
Dr. Barker is secretary and Dr. Mooney is executive assistant of the Connecticut Medical Examining Board.

brought many drastic changes. At this time, no agency except the State Board of Medical Examiners in New York, which Dr. Lochner told us about a year ago,¹ has reliable information concerning these schools.

While it is possible that the peak of the years 1938 to 1942 may not again be experienced, the problem is still with us. There are literally thousands of displaced physicians in central Europe. Many more, although not actually displaced, are unhappy and are using every means to remove themselves elsewhere, particularly to the United States.

FUTURE PROBLEMS

The future is further dangerous by reason of three other factors. One is the tremendous present enrolment in German medical schools, as was reported here a year ago by Dr. Wright,² and which I (C. B.) observed in detail while I was with the American Military Government there last September. How these new thousands of physicians can be absorbed into the economy of a bankrupt and all but ruined country, already oversupplied with medical personnel, is impossible to understand.

The second reason for concern is the ruling of the Veterans Administration that American veteran students may use their allowances under Public Law No. 346 (G. I. Bill of Rights) to obtain education, including medical education, in foreign schools. Mention of this was made in Dr. Lochner's paper¹ last February, and, since that time, a large number of examining boards have written to the Veterans Administration criticizing this ruling and stating that veteran graduates so trained will not be eligible for licensure here when they return. The Veterans Administration has not changed its stand, but, from recent correspondence, I am led to the impression that a better effort is being made to inform these students that there is no assurance that they can be licensed to practice in this country. I am sure that many of you have had inquiries about their eligibility from these prospective students. The bulk of them seems to be gravitating toward Switzerland. When I was in that country last summer, I asked representatives of several schools about the status of American students and inquired whether they had any. I gathered, without collecting actual figures, that in several Swiss schools as many as 10 per cent of the students are Americans. The Swiss welcome our students and say they find them well prepared.

Finally, there is the increasing awareness on the part of the public of the apparent shortage of physicians. The expression "apparent shortage" is used advisedly because no one seems to know the real answer. Statisticians of the American Medical Association tell us that we are better supplied with doctors than any other country in the world and that there is no shortage. The first statement is undoubtedly true, but perhaps because of our broad field of medical care in the United States we need a great many more than any other country. It is said that there is faulty distribution, and probably that can be admitted, but it is a natural distribution that seems highly satisfactory to the physicians who distribute themselves badly, and that is an element of our freedom. In any case, statistics are cold comfort to communities that cannot get a doctor and state hospitals that cannot fill their staffs.

The concerned public is thinking, as Dr. Murphy of the University of Kansas pointed out, that the medical profession itself is limiting the production of physicians as a matter of self protection. Certain groups of this same public are also accusing medical examining boards of limiting the supply of physicians by not admitting émigrés to licensure. A few states have already been sharply faced with this, and I believe that others of us will be. Representative Case of South Dakota introduced a bill into the Congress on January 31 that would let five hundred additional displaced doctors enter the United States from Europe for service on Indian reservations without state license. All of us here must realize that these potent influences are at work.

VARIATIONS IN STATE BOARD REGULATIONS

The ways for meeting this problem of licensing foreign graduates, particularly those from European and Latin American schools, vary from state to state, and although last June the Council published an analysis of the rules of boards, these rules change rapidly and what applied then is different now. At best it is difficult to get an over-all picture. Last autumn, with the approval of Dr. W. L. Bierring, Secretary, Federation of State Medical Boards of the United States, we undertook a canvass of all the states and territories to determine which laws and regulations apply. The inquiry was answered generously by all of you and I wish to thank you for your assistance. Information was received from all but one state; Florida is missing. I shall try to consolidate the findings. However, it must be admitted that it is not always possible to make categorical statements because there appears to be a good deal of flexibility in some regulations. I hope my summary is accurate and helpful, but I realize it is subject to comment and perhaps revision because the information received has not always lent itself to exact interpretation.

Canadian Graduates.—Strictly speaking, Canadian schools should be classified as "foreign." Generally, however, graduates of Council-approved Canadian schools are accepted on the same basis as graduates of schools in the United States. An exception is Massachusetts, which has a recently established Approving Authority. As of November 1948, that Authority had approved only four schools in Canada for matriculants after Jan. 1, 1948. Graduates of Canadian schools prior to that time are not affected.

Michigan does not accept graduates of Canadian schools unless they repeat the fourth year of training in an approved school in the United States. This seems a little unusual since the Canadian schools are Council approved, but the rule appears to have been established to restrict foreign graduates and Canada became involved. Louisiana has a similar rule, but it is not applied to Canadian graduates. The requirement of United States citizenship deters some Canadian nationals. Thirty-two states, Alaska, Hawaii and Puerto Rico require that candidates be citizens of the United States. Eight of these states, however, exempt Canadians from this requirement. Louisiana requires first papers and withholds permanent license until naturalization.

Foreign Graduates.—As to graduates of schools outside of North America, widely diverse and increasingly restrictive regulations are found. In most cases, these are rules established by boards rather than by

1. Lochner, J. L.: Licensure Evaluation of European Medical Graduates, *J. A. M. A.* 137: 16 (May 1) 1948.

2. Wright, I. S.: Medical Education in Germany and Austria, *J. A. M. A.* 137: 5 (May 1) 1948.

statute. From this point on, graduates of Canadian schools will not be included in the discussion. There are a few minor limitations put on the endorsement of United States licenses for graduates of Canadian schools, but they do not have broad significance.

The data at hand show that twenty-three states will not admit graduates of any schools outside the United States and Canada. The special regulations in Michigan have already been mentioned; Florida and the Virgin Islands are not included in the analysis. The territories of Alaska, Hawaii, Puerto Rico and the Canal Zone will be mentioned briefly. Alaska admits foreign graduates. Hawaii states that foreign graduates are not admitted, "but there may be exceptions"; United States citizenship is required. Puerto Rico accepts foreign graduates after individual consideration, and applicants must be citizens. There is no private practice in the Canal Zone and civil service rules apply.

Twenty-two other states and the District of Columbia remain to be considered. Two of these, Mississippi and Rhode Island, appear to admit foreign graduates without much restriction. Eight states do not accept foreign graduates after a fixed date. The dates established are usually in the early years of World War II. Three states require that the candidate be eligible for examination by the National Board of Medical Examiners. This rule has served to bar foreign graduates because the National Board has not admitted them for a number of years. Mr. Everett S. Elwood, the executive secretary, has informed me lately that the board now accepts graduates of medical schools connected with the universities in England, Scotland and Ireland. The remaining nine states are quite difficult to classify and can be grouped only as those states which state that each case is given individual consideration, and what rules guide those considerations I do not know. There appear to be exceptions for graduates of schools in Great Britain. Some states will accept such graduates when they will not admit graduates of continental or South American schools. It is probable that there is still confusion on the part of some of the boards about the University of Edinburgh, an ancient school of high repute, and the extramural schools of Edinburgh.

SUMMARY

So far as fixed and understandable regulations apply, and for practical purposes, there are eight states in which recent graduates of foreign medical schools can be admitted. This conclusion is somewhat inconsistent with the licensing records of 1947 published by the Council on Medical Education.³ The discrepancy may be explained in part by the change in rules in several states since 1947, as is the case in Connecticut, and the inclusion under the classification "foreign medical faculties" of schools in Great Britain whose graduates are acceptable in several states. Also during the past few days I have learned of new policies in North Dakota and Minnesota. It seems from our data that the eight states are: California, the District of Columbia, Georgia, Maine, Mississippi, Missouri, Rhode Island and Virginia.

I suppose that exceptions will be taken to the statements that I have made, and, if they are, it serves to show how confusing and uncertain the regulations are.

WHAT SHOULD THE GENERAL PRACTITIONER DO ABOUT ALLERGY?

STEARNS S. BULLEN Sr., M.D.
Rochester, N. Y.

There is a growing body of evidence that altered reactivity of the tissues on reexposure to certain substances is the causative factor in the production of several diseases the causation of which has been obscure, such as periarteritis nodosa, dermatomyositis, acute glomerular nephritis and others. However, it is the allergic manifestations which appear on the covering and lining membranes of the body, that is, the skin and the mucous membranes of the respiratory and gastrointestinal tracts, which present the day by day problems in practice. These include the eczemas of the infantile, "atopic" and contact types; urticaria; coryzas of the seasonal and perennial varieties; asthma, and some disturbances of the gastrointestinal tract which are usually functional in nature and in which the tissue changes are generally reversible.

In uncomplicated cases, these allergic diseases seldom cause death, but their chronicity and the suffering and disability which they produce demand careful clinical consideration, especially in the early stages, because the physical changes in the tissues are largely reversible and proper treatment may prevent permanent damage. The frequency with which they occur and the variability of their manifestations make it certain that every physician will be confronted with the problems which they present.

It is known that allergic persons differ from the average in the manner in which they react to contact with certain substances. It is sometimes forgotten that they are subject to the same psychic and somatic disorders as are the rest of the human race and that these nonallergic disturbances may modify the allergic disease or be modified by it.

It is an axiom that adequate treatment depends on accurate diagnosis. Accurate diagnosis in the allergic diseases does not consist merely in attaching a name to the presenting syndrome, but is concerned with finding the cause of the disturbance which produces that syndrome.

DIAGNOSIS

As in other fields in medical practice, the most important diagnostic measure is a complete and detailed history. Such a history can be obtained and evaluated only if the history taker has a knowledge of the usual pattern of symptoms of the disease in question and is willing to take time to build up the clinical picture from the beginning and not be content merely with a description of the most recent attack. This is especially important in the case of the allergic diseases because they tend to recur over such long periods of time that the primary cause which loaded the gun may be hidden by a number of factors of less importance which at various times have pulled the trigger and caused explosions of symptoms.

Certain generalities may give a framework on which the picture can be built up. The age of onset of symptoms may suggest important connotations. Food sensitivity is a common cause of allergic diseases which

3. Medical Licensure Statistics for 1947; Forty-Sixth Annual Presentation of Licensure Statistics by Council on Medical Education and Hospitals of American Medical Association, J. A. M. A. 137: 603 (June 12) 1948.

From the Department of Medicine, School of Medicine and Dentistry, University of Rochester, Rochester, N. Y.

Read before the Section on Miscellaneous Topics in the Session on Allergy at the Ninety-Seventh Annual Session of the American Medical Association, Chicago, June 23, 1948.

begin in infancy and early childhood, with inhalant sensitivity in a relatively minor role. When the manifestations begin in later childhood and the adolescent years, food allergy occurs with lessened frequency and inhalant sensitivity appears oftener. In my experience, food sensitivity is seldom the cause of allergic disease which begins in young adult life and later, whereas inhalants can commonly be incriminated. In asthma which begins after the age of 40, specific sensitivity to extrinsic factors can seldom be found by any test presently available.

In the case of the dermatoses at all ages the possibility of sensitivity to some substance which comes in contact with the skin must be considered.

The time of year at which symptoms occur is often suggestive. Coryzas, often accompanied with asthma, which conform to the pattern of seasonal hay fever and which coincide in onset and offset with the pollen seasons in a given locality can usually be proved to be caused by sensitivity to pollen. However, in the northeastern states, the season at which mold spores are in greatest abundance in the air roughly coincides with the ragweed pollen season and mold sensitivity must be kept in mind.

The presence of animals in the household or in the immediate environment should be noted. I have been impressed with the number of cases of allergic coryza, asthma and eczema which flare up each fall when the heating plants are started and which can often be explained on the basis of dust sensitivity. The occupation of the patient and other members of the household, who may bring home dusts of various kinds on their clothes, must be investigated.

The present widespread use of the new synthetic drugs and antibiotics makes it especially important to inquire about the use of medicaments, because, in general, the only way to determine whether they are causative factors is by history and clinical trial by administration to the patient, a procedure which may be dangerous.

The fact that the leading manufacturers of cosmetics expend so much effort in producing "hypoallergic" preparations is good evidence of the importance of these substances as sensitizers. The relation of the occurrence of symptoms to the use of such things as wave sets for the hair, perfumes, makeup preparations, deodorants, depilatories, sun tan lotions and nail polish needs consideration.

As the plastics have come into greater use, it has become increasingly evident that they not infrequently produce sensitivity. While the workers who handle these substances are the persons most likely to experience dermatoses or allergic manifestations in the respiratory tract as the result of sensitivity to them, instances of such sensitivity in the general population are by no means uncommon.

A detailed story of the manner in which symptoms developed in an acute attack often gives evidence suggesting the type of substance which is the cause. An attack of asthma, urticaria or dermatitis appearing a short time after the ingestion of a food or drug, especially if this occurs repeatedly, points to the obvious relation between the two events. Likewise, the prompt appearance of symptoms after contact with an animal or a cosmetic preparation or after exposure to large amounts of dust gives strong evidence that an inhalant sensitivity must be suspected.

Patients frequently make such statements as "I just get over one cold when another one starts," or "I have asthma only when I catch cold." In a majority of such cases, questioning will develop the story that these "colds" fit into the pattern of symptoms of allergic coryza, with nasal obstruction, watery nasal discharge which does not become thick and purulent, paroxysms of sneezing and, at times, redness and itching of the eyes and itching in the throat. In children in whom asthma follows these symptoms of the upper part of the respiratory tract, especially if little or no fever is present, inhalant sensitivity should be suspected.

It is often difficult to rule out infections as the cause of the coryza, but if these episodes recur every two to four weeks, infection is improbable.

In conditions like seasonal hay fever the essential historical background can usually be obtained in a short time. However, in cases of long-continued asthma and in the dermatoses it is commonly necessary to go over the story time after time to develop new leads which the patient may have forgotten or which have seemed insignificant to him. It is common knowledge that it is seldom possible to get an adequate picture of a patient's personality and the way he may be affected by domestic discord or difficulties with his job except by repeated interviews.

The physical examination in allergic conditions, as in other medical problems, should aim not only to evaluate the observations of the presenting syndrome but to determine the presence or absence of disease due to other causes. In an otherwise complete examination, too often a study of the nose is neglected.

Nasal obstruction due to a swollen pale mucosa plus a large amount of thin mucoid discharge is suggestive of an allergic coryza, rather than one due to infection. Not infrequently, however, even in such clearcut allergic conditions as seasonal hay fever, the appearance of the nasal mucous membrane may be normal in the middle of the day even though the patient may have pronounced symptoms morning and evening. The presence or absence of nasal polyps should be determined and a search made for purulent discharge from the sinuses.

Cutaneous tests for sensitivity have attained a deservedly important place in the specific diagnosis of the cause of allergic diseases. However, like all other tests, they deserve serious consideration only when properly done and the results well evaluated. It must be remembered that positive reactions to scratch or intradermal tests of the immediate wheal type will be obtained only in conditions in which a skin-sensitizing antibody is present. Such an antibody usually exists in allergic diseases affecting the respiratory tract, but occurs much less frequently when the manifestations occur on the skin or in the gastrointestinal tract, and, therefore, in these latter cases, such tests are frequently of no diagnostic value.

Whether one does scratch or intradermal tests is a matter of individual preference, if it is kept in mind that the material for the scratch test must be fifty or more times stronger than that for the intradermal method. It is worthy of emphasis that a scratch test with an extract of strength appropriate for intradermal testing may fail to give a positive reaction because it is too weak, and, conversely, that one appropriate for scratch testing may produce a serious generalized reaction if it is injected into the skin.

A common error in scratch testing is the failure to rub off the blood clot from the surface of the scratch, thus preventing the test material from coming in contact with the cells in the deeper layers of the skin. With the intradermal technic, all too frequently, too much material is injected, producing nonspecific whealing which may be wrongly interpreted as a positive reaction. An amount not to exceed 0.02 cc. should be used. It is obvious that fluid preparations must be used for intradermal testing, and it must be remembered that fluid extracts tend to lose their potency and must be renewed frequently.

Contact or "patch" tests, by which an attempt is made to reproduce in miniature at the test site the lesion of a contact type dermatitis, are not interchangeable with scratch or intradermal tests. They are not of value in conditions affecting the internal organs, nor do scratch or intradermal tests commonly give information in cases of contact dermatitis.

Positive cutaneous reactions do not, with certainty, mean that the substance giving the reaction is the cause of the presenting symptoms. If a positive reaction is to be considered significant, it must be possible to show that contact with the reacting substance actually produces the symptoms. Often evidence that such is the case may be obtained from the history, but occasionally it is necessary and desirable to attempt to reproduce the symptoms by exposure to the reacting substance. On the other hand, negative cutaneous reactions do not, with certainty, rule out the possibility of sensitivity to the substances tested. This may be due to the fact that the test substance is too weak to produce a positive reaction, or that it is not of the exact chemical composition of the material which produces the symptoms.

Cutaneous tests with drugs give almost uniformly negative reactions even in cases of proved clinical sensitivity to them. Tests with bacterial extracts are also unsatisfactory, seldom producing the immediate wheal reaction. Delayed reactions of the tuberculin type are common, but they mean only that the body has been invaded by the organism in question at some past time and has produced antibodies which react with the antigen, and, while this reaction is specific for the organism, it usually has no relation to the clinical syndrome.

"Group" testing in which a short cut is sought through the use of groups of biologically related substances in one extract is untrustworthy. It has been suggested as a means whereby, with a relatively small number of tests, a patient may be "completely studied" for sensitivity to everything with which he may conceivably come in contact. Because one substance in the group may be irritating to the skin, a false positive reaction may implicate the whole group, or, on the other hand, a potential reactor may be in too great dilution to give a positive reaction. A selection of test materials, based on an evaluation of the clinical picture as developed by the history, gives a more intelligent and practical approach to the problem.

While it is improbable that complete agreement will be reached on what tests shall be used routinely, it is generally conceded that, in the average case, when the tests are chosen intelligently, with relation to the pattern of symptoms presented, a few dozen will give adequate information. Such a list may be comprised of extracts of the pollens and molds prevalent in the

locality where the patient lives; materials from furniture and mattress stuffing, such as cotton and kapok and their seeds; dust; cosmetic preparations, such as wave set materials and orris powder; the epithelium of the domestic animals, including feathers, and the common foods, such as milk, egg, cereals, chocolate, vegetables, meats, nuts, fish, shellfish and fruits.

In some patients, of course, the history will suggest other leads which must be followed up. However, if it is remembered that frequently recurring bouts of symptoms must come from frequent or regular exposure to the excitant, the possibilities can be fairly well delimited.

Tests in cases of contact dermatitis must be chosen for the individual case as the history suggests possibilities and may range from nail polish, cosmetics and soaps through a great variety of substances used in industry.

Results of tests with extracts of foods are often disappointing. This may be due to the fact that the extract does not contain material of the same chemical structure as that which is ingested or that the specific excitant is a partial digestion product of the food and as such is not contained in the test material. Another important factor may well be that food tests are often used indiscriminately in many conditions in which food sensitivity rarely occurs.

When food sensitivity is suspected in spite of negative reactions to cutaneous tests, clinical trial by means of an elimination diet and the later addition of foods, one at a time, may give useful information. If a food is the cause of symptoms, improvement should result in a relatively few days and a patient should not be kept on a rigidly restricted diet for long periods. Because food sensitivity is so rarely the cause of a condition like asthma which begins in middle life or later, elimination diets are unwise in such cases.

Roentgen studies of the sinuses, teeth, chest and gastrointestinal tract are frequently necessary. The observation of eosinophilia in the blood and secretions from the respiratory tract, when other causes of eosinophilia can be ruled out, gives confirmatory evidence of the presence of an allergic process, although its absence does not prove that allergy is not the cause of the symptoms.

TREATMENT

In allergic diseases, as in all others, the best treatment is removal of the patient from contact with the cause. Hyposensitization by injection of extracts of pollens, molds, dusts and the like is much less satisfactory, but is often necessary. It would seem unnecessary to emphasize the importance of choosing extracts of substances which fit into the clinical picture which the patient presents if it were not for the all too frequent use of, for instance, grass pollen extract for treatment of patients who have symptoms only during the ragweed pollen season.

Injection therapy in allergic persons is not without danger, and the dosage must be regulated in accordance with the tolerance of the patient. Hyposensitization by means of injecting extracts of foods and drugs has been proved to be valueless.

The eradication of foci of infection in the teeth, tonsils and sinuses is desirable, but the usual indications for such operations should be present. They should not be done solely because asthma or allergic coryza exists.

Treatment for the temporary alleviation of symptoms by means of epinephrine and similarly acting drugs or expectorants is usually necessary. To this group, the antihistaminic drugs have been added. Some recent printed and radio advertising would seem to try to give the impression that it has been established that the liberation of histamine explains all allergic manifestations and that these can be controlled by the administration of the advertised drug.

The antihistaminic drugs are definitely useful. As with ephedrine, when it was first introduced, there is a tendency for one to rely on them too much, instead of searching for and treating the cause.

The vast literature dealing with allergic disease has been well summarized in several books¹ which make available in convenient reference form present day knowledge of this complicated subject.

The answer to the question presented in the title of this paper differs in no way from the procedure in any of the other branches of medicine, which have been accepted as specialized fields.

1. The general practitioner may undertake the necessary diagnostic studies and carry out the indicated treatment.

2. He may not care to make or have the facilities for making the special studies and may refer the patient to a qualified person for diagnosis and then carry out the treatment himself.

3. He may desire to transfer the whole problem to some one working in this field.

ABSTRACT OF DISCUSSION

DR. JOHN H. MITCHELL, Columbus, Ohio: In at least one third of patients with perennial asthma, the history, cutaneous tests and clinical trial with disguised allergens fail to demonstrate specific hypersensitivity and no physical cause such as heart disease, emphysema, tumor, foreign body, or bronchiectasis can be found. There remain then those difficult cases of asthma in which the condition fails to fit the allergic pattern and is classified as "intrinsic." Since personality factors are often of major significance in many nonseasonal allergic disorders, a good history is essential. When the patient is permitted to tell his story in his own way, pertinent diagnostic data are obtained, but of greater importance is the therapeutic effect of such free expression. Moreover, if the physician is more than a kindly attentive listener and carefully abstracts the feelings and the emotional content from the patient's statements, calmly reflecting these back to him, a dynamic process is initiated which allows further discussion of deep emotional feelings and significant personal problems. In this patient-centered nondirective approach, the early interviews are characterized by a multiplicity of complaints and numerous statements of negative emotional attitudes, such as confusion, fear, escape, dependency, hostility, rejection, social maladjustment and unhappiness. The patient thus assumes more and more responsibility for his illness and for talking about himself. The physician, on the other hand, is relieved of asking direct questions, of interpreting the psychologic meaning of the

patient's statements and of giving advice and direction about personal problems. Since only conscious material which has been verbalized is dealt with, there is little danger of doing psychologic harm or of aggravating symptoms. As the interviews continue, attitudes become more positive, statements of improvement are frequent, insights develop and the patient becomes aware of relationships between his bodily disorders, emotional conflicts and personal problems. In the successful case, the patient finally sees better ways of doing things and makes the necessary choices to improve his life pattern. Thus, relating the history becomes a profound psychotherapeutic experience where, with the aid of the interviewer's skill, problems are faced and worked through to a satisfactory solution. Although many previously frustrating and apparently hopeless problems in allergy have been controlled, the beginner should realize that as his interviewing skill increases its therapeutic effectiveness also improves.

LOBOTOMY FOR INTRACTABLE PAIN

JOHN B. DYNES, M.D.

and

JAMES L. POPPEN, M.D.
Boston

Pain is a frequent symptom of disease or injury and in most instances may be relieved by the removal of the underlying cause or by the use of anesthetic agents or analgesic drugs, or it may be tolerated with fortitude and varying degrees of resignation by those who possess such qualities of temperament. Every physician has patients in his practice who experience pain which is unrelieved by the usual measures and in whom great physical and mental suffering result. Not infrequently such patients are totally incapacitated, a burden to their families, addicted to drugs, at times mentally unbalanced, unpredictable and always self concerned. In the majority of instances, if not in all, there is originally a discernible anatomic or physiologic reason for the pain experienced. In certain instances, however, a fixed pain pattern is set up prior to the removal of the existing cause. This pain pattern may be interrupted or altered by a variety of therapeutic procedures (psychotherapy, psychoanalysis, hypnosis, nerve block, nerve section, shock therapy, drug and sleep therapy, general anesthesia, sympathectomy, cordotomy and, finally, lobotomy). We do not intend to imply that these procedures are always applied in the order named, as patients with intractable pain secondary to a metastatic malignant condition (to mention only one cause of pain) should not be treated in the same way as patients having intractable pain and secondary drug addiction and in whom there is no evidence on examination of the original disease that initiated the pain pattern. We believe, however, that it is advisable in the latter instance to apply any or all of those measures which are likely to alter the pain pattern before one undertakes operative procedures that permanently interrupt certain nervous pathways.

Prefrontal lobotomy (the surgical severing of the neural pathways to the frontal lobes of the brain) was introduced by Moniz,¹ in 1936, for the treatment of certain mental disorders. Freeman and Watts² first

employed this operation in the treatment of mental disease in this country, and they were also the first to call attention to the fact that after lobotomy several patients were relieved of pain, if pain was a prominent preoperative symptom associated with their mental disorder. It was not until 1946³ that reports appeared in the literature in which patients having intractable pain as their chief or only symptom were subjected to this operation.

Lobotomy for the relief of intractable pain has been performed on 18 patients at the Lahey Clinic and forms the basis of the present report. Of this number there were 9 who had metastatic malignant disease. Of the remaining 9 patients in the heterogenous group, 2 had an atypical tic douloureux and 1 had a cerebral aneurysm and intractable pain from headache which was not relieved by ligation of the internal carotid. Two patients had gastric tabetic crises, 1 of these having a

table illustrates the preoperative diagnoses and the degree of benefit derived from the operation, as well as certain other interesting and pertinent information about these patients.

The symptoms following lobotomy in these non-psychotic patients were variable, but in general our patients revealed two postoperative behavior patterns with occasional mixtures of these two patterns of behavior. In this respect, our data are in agreement with Stevens and Mosovich.⁴ In one group the behavior of the patients was uninhibited and euphoric, and they were somewhat restless with a seemingly purposeless type of activity. Those in the second group were slowed up in both thinking and acting; they were dull and at times completely lacking in emotional expression or display and showed a striking reduction in interest and driving energy. There seemed to be one consistent regularly occurring personality trait which character-

Summary of Cases

Case No.	Age, Yr.	Sex	Clinical Diagnosis	Duration of Symptoms	Personality		Date of Lobotomy	Relief from Pain	Relief from Mental Suffering	Narcotic Addiction	
					Before Lobotomy	After Lobotomy				Before	After
1	48	M	Metastatic carcinoma of lung	6 mo.	Normal (extravert)	Euphoric (mixed)	Dec. 1947	Good	Excellent	Yes	No
2	56	M	Carcinoma of rectum	3 yr.	Normal (introvert)	Retarded	Jan. 1948	Poor	Good	No	No
3	53	M	Carcinoma, metastatic	6 mo.	Normal	Retarded	Dec. 1947	Good	Good	No	No
4	28	F	Carcinoma of rectum	3 yr.	Normal (extravert)	Euphoric	Jan. 1948	Excellent	Excellent	No	No
5	59	F	Carcinoma of rectum	3 yr.	Normal (introvert)	Retarded	Dec. 1947	Good	Excellent	No	No
6	48	F	Carcinoma of cervix	1 yr.	Normal	Retarded	Dec. 1947	Good	Excellent	Yes	No
7	38	F	Carcinoma of breast	7 yr.	Anxiety state	Euphoric	April 1947	Fair	Good	Yes	No
8	60	M	Carcinoma of lung	1 yr.	Normal (introvert)	Retarded	June 1947	Excellent	Excellent	No	No
9	61	M	Carcinoma of lung	6 mo.	Normal	Retarded	Jan. 1946	Good	Good	No	No
10	34	F	Tic douloureux, atypical	4 yr.	Anxiety state	Euphoric	May 1944	Excellent	Excellent	Yes	No
11	30	F	Aneurysm, cerebral	5 yr.	Constitutionally inadequate	Retarded	July 1946	Good	Excellent	Yes	No
12	55	M	Gastric crises (negative serologic reaction)	25 yr.	Psychopath	Euphoric (mixed)	April 1946	Fair	Excellent	Yes	No
13	60	M	Tabetic crises (positive serologic reaction)	24 yr.	Anxiety state	Euphoric	July 1946	Good	Good	Yes	No
14	40	M	Brachial neuralgia	3 yr.	Psychopath	Retarded (mixed)	Oct. 1946	Good	Good	Yes	No
15	67	F	Sciatica	25 yr.	Hysteria	Retarded	Jan. 1946	Fair	Fair	Yes	No
16	65	F	Arthritis; cervical osteoma	7 yr.	Menopausal (agitated)	Retarded	Feb. 1947	Poor	Fair	Yes	No
17	62	F	Tic douloureux, atypical	12 yr.	Psychopath	Retarded	July 1947	Poor	Fair	Yes	No
18	38	F	Lipoma, cauda equina	10 yr.	Behavior disorder	Euphoric	Jan. 1945	Good	Excellent	Yes	No

positive serologic reaction and definite evidence of tabes and the other having consistently negative serologic reaction. Another patient had brachial neuralgia following sympathectomy. Another had sciatica with intractable pain. Another had arthritis and a cervical osteoma, and the last patient had a lipoma involving the cauda equina. All of these patients had received quantities of narcotic and analgesic drugs, in an effort to relieve them of pain, and many of them were definitely addicted to drugs. Most of these patients had had some operation previous to lobotomy, such as rhizotomy, nerve block or cordotomy, in an effort to relieve them of the intractable pain, but these operative procedures had not been successful. In selecting patients for this operation of lobotomy, we relied chiefly on the degree of incapacity or disability of the patient, the duration of symptoms, the potential seriousness of the existing disorder (malignant conditions) and the failure of all other types of therapy. The

ized all patients who had had a lobotomy. This was an inappropriate or misplaced emotional reaction or response. It was not lack of emotional response as our two groupings of behavior patterns would indicate, but the inappropriateness of the reaction. For instance, it could not be said that the euphoric uninhibited patient did not display some emotion, but the quality of his emotional response was altered or perverted. The same was true for the slowed up person who showed diminished driving energy. From observing their behavior, one might think that such patients were depressed or melancholy, but they never admitted that they were mentally depressed and at no time did they show grief or shed tears. They were indifferent to sorrow and grief and seemed incapable of sensing or appreciating the feelings of others. One would hardly characterize these patients as being selfish or egocentric when they apparently were incapable of appreciating or behaving as if they understood the quality of the situation in which they found themselves. This alteration in their

emotional response was accompanied with varying degrees of inertia or apparently purposeless restlessness. Patients would mechanically carry out routine household duties or other fairly simple and routine tasks, but in this group, after lobotomy, there was no one who was capable of creative work. As an example, one patient (case 12, table) was an inventor, and although after lobotomy he was euphoric and restless and showed no distinct intellectual or memory deficit, he was totally incapable of creative work or the visualization of a problem. He was unable to concentrate or to plan for the future. He seemed to lack interest or actually to be able to maintain an interest for more than a few minutes at a time. Incentive or the reason for being interested in an invention no longer appeared to be present. He had no appreciation of the value of money, nor did he have an interest in increasing his holdings, although he had a good income from previous inventions. At the time of last observation he was incapable of judiciously administering his estate, although he was relatively free of pain and no longer addicted to narcotics.

This raises the question of medicolegal responsibility of a patient who has had a lobotomy. To our knowledge, there have been no court rulings in this matter. The ordinary criteria for establishing mental competency would not appear to be greatly altered. The patient's memory is not usually greatly impaired. From ordinary questioning one would gather that he seems to know what he is doing and what he wishes to do. Undoubtedly, the question of "understanding the nature and the purpose of his acts" could be debated. However, the permanent alteration of those elements of personality that have to do with the patient's emotional life and his affection and regard for his family and friends are of great importance. The making of wills and, when indicated, the appointment of proper persons to be responsible for the patient's affairs would seem reasonable, as every one would agree that although lobotomy produces definite alleviation from certain mental symptoms, and also alteration of pain, it also produces permanent alteration in the patient's personality. These comments apply to the person who was judged insane or incompetent before lobotomy and even more so to those patients reported here who were not considered mentally unbalanced prior to lobotomy for intractable pain.

The primary objective in this series of patients was the relief of pain. In general, the 9 patients who suffered from pain of metastatic malignant disease were more successfully relieved of pain and mental suffering than the 9 remaining patients, although there were exceptions. Only 1 patient who had malignant disease could be considered to be neurotic or unstable emotionally prior to the development of cancer. This was not true of the remaining heterogeneous group of 9 patients as listed in the table, for it will be noted that all of these 9 patients in the heterogeneous group had some form of personality disorder. The better results in the group with pain secondary to metastatic malignant disease could be more closely correlated with their previous stable type of personality than with any other single factor. We do not intend to imply that the results were good in all patients with malignant disease and poor in those with no malignant disease or those in the heterogeneous group, but this may be determined by reference to the table.

In addition to the relief of pain, lobotomy relieves the patient of worry and concern, and in patients who are dying of cancer there can be no doubt that their remaining days are free of mental suffering and happier than they would otherwise have been. Patients who, prior to lobotomy, were racked with pain and unusually fearful of death could, after lobotomy, talk freely about their disorder and approaching death with apparent complete detachment and absence of emotional feeling or concern. Certain patients with metastatic malignant disease never again complained of pain in the few remaining months of life. This, however, was the exception and not the rule. Most patients with metastatic malignant disease continued to complain of pain if asked whether they had pain; however, if no comment was made to them and no questions asked, they would not spontaneously complain of pain after lobotomy. We are not able to explain this alteration in the pain pattern other than to say that it was altered by what appears to be the severing of one of the essential links in the pattern. The patient, as a rule, was unconcerned about pain, and in practically all instances he was no longer anxious and fearful as he had been prior to lobotomy. He tolerated pain with little or no objective evidence of suffering. This was true of both the group with metastatic malignant disease and the heterogeneous group previously mentioned. It was not necessary again to resort to the use of narcotics in either group, although a number of patients were given sedatives and some were given narcotics to quiet restlessness. It did not seem to make much difference what type of medication was given. One type of medicine seemed to have as much effect as another. Those patients who had been addicted to narcotics before lobotomy were able to dispense with them completely after the operation. Of the 18 patients in this series, 12 were addicted to narcotic drugs prior to lobotomy. Only 3 of the 9 with metastatic malignant disease were considered to be addicted to either morphine or meperidine hydrochloride (demerol hydrochloride®), whereas all 9 in the heterogeneous group of patients suffering from intractable pain were considered to be addicted to narcotics. This does not mean that the 6 remaining patients in the group with metastatic malignant disease had not been taking narcotics. All patients in this series had been taking narcotic drugs. Certain patients had rather severe withdrawal reactions following lobotomy, and narcotics were gradually withdrawn completely in this group.

Lobotomy for intractable pain appears to benefit the patient in two ways. The first is by an alteration of the pain pattern or the patient's appreciation of pain, the exact mechanism not being known, and, second, by an alteration of the patient's personality so that he no longer worries or is concerned about the problems of living or the pain of dying. Mental suffering is reduced and in most instances abolished by this operation. The great value of this procedure for patients dying of metastatic malignant disease, we believe, is related more to the alteration of the patient's personality and the subsequent reduction of mental suffering than it is actually to the relief of pain, although, as we have said, there were certain patients who never again complained of pain following this operation.

SUMMARY

Lobotomy for the relief of intractable pain has been performed on 18 patients at the Lahey Clinic. Relief of suffering, both mental and physical, was accomplished by this operation. In general, the results were more favorable in patients with metastatic malignant disease than in any other group and least satisfactory in those patients who displayed an exaggerated pain response in the presence of long-standing emotional instability, although there were exceptions. Lobotomy in this series definitely altered the patients' anxiety and fear reaction in such a manner that no anxiety, fear or concern over their impending death from cancer was manifest. Selection of patients is discussed, and the characteristic changes in personality following lobotomy are recorded. The case histories are briefly summarized in the table. In selected cases of metastatic malignant disease and also in cases of chronic pain of other origin, lobotomy may become the operation of choice to relieve intractable pain and the related mental suffering.

ABSTRACT OF DISCUSSION

DR. Y. D. KOSKOFF, Pittsburgh: The therapeutic effect of lobotomy in these 18 patients confirms the efficacy of this procedure in the treatment of chronic pain. Reduction of drug dependence is most gratifying. In the Pittsburgh series, my co-workers and I did not observe significant symptoms due to withdrawal of drugs. Indications for lobotomy described by the authors appear appropriate but perhaps a little rigorous. Unilateral lobotomy, ipsilateral or contralateral to the pain sites, appears useful for a definite period in certain chronic pain states. May not this procedure be offered prior to a last resort measure? The authors' explanation of the relatively better results in the group with malignant disease, because of their more intact personalities, is worthy of emphasis. Computation of the authors' data indicates that symptoms persisted for an average of 2.2 years, as contrasted with 12.8 years for the group without malignant disease. May not this difference be a factor in the better results in the group with malignant disease? The second point concerns itself with the psychologic effects of lobotomy. These data well support prior observations with their emphasis on the inappropriateness of the responses of the lobotomized patient. We did not observe specificity of function loss. Not only are creative capacities dulled, but the entire intellectual orbit may be affected. The third point deals with the theoretical explanation of the relief of chronic pain following lobotomy. The authors indicate two possible mechanisms: First, an alteration of the pain pattern; would the authors describe its nature? Second, "unconcern for living or dying"—eloquently described in this paper—this result is certainly basic. In any evaluation of the extent of relief, dichotomy of concept, namely, physical pain as distinct from mental pain, may become misleading. Both psychic and physical irritants converge in chronic pain states to form the basis of suffering. In a sense, frontal lobotomy is not surgical treatment for the relief of pain, but rather surgical treatment for the relief of suffering.

DR. WILLIAM P. CHAPMAN, Boston: These patients before lobotomy had not been relieved either by intensive medical treatment or by surgical treatment or by other forms of therapy, and after lobotomy about 14 of the 18 patients had been relieved. Apparently varying degrees of intellectual impairment and personality change are to be expected following this procedure. For that reason the decision to offer this operation for relief of pain in the group of patients in the younger age range or in persons in whom the pain is not due to a malignant or terminal type of lesion is difficult; this decision will probably remain difficult until more is known

of the over-all effect of lobotomy not only in the psychotic patients but in those patients with intractable pain who are relatively free of psychiatric illness and whose symptoms are really only the emotional symptoms which are associated with the pain. At the Boston Psychopathic Hospital we have been interested in the factors which may account for the relief of pain in these patients. We have been surprised to find that after lobotomy these patients tolerate less heat discomfort when applied to the forehead than before operation. This also applies to heat discomfort which is applied to other parts of the body. The Hardy-Wolff-Goodell pain threshold apparatus was used for these studies. In the group of 23 patients studied it was not possible to obtain pain perception thresholds presumably due in part to their mental state. At the end of the fifteen to sixty day postoperative period, and at intervals of three, six and twelve months after lobotomy, these patients winced and pulled their head away from the apparatus at significantly less intense heat stimulation than on either test I or test II before lobotomy. We have no explanation for the discrepancy that, on the one hand, these patients may be relieved of intractable pain by lobotomy and yet seem to tolerate less readily stimuli such as are applied to the skin. It would seem that, whatever the mechanism or the factors responsible for the relief in these patients, it is not related to the fact that they can tolerate more readily after lobotomy discomforting stimuli such as were applied to the skin.

DR. WALTER FREEMAN, Washington, D. C.: With regard to frontal lobotomy for the treatment of intractable pain, we are probably in the same position that we were five or six years ago in the treatment of mental disorders. We have learned that it can be done. Now we have to find out how it can be done without sacrifice of useful personality functions. It is rather easy to relieve pain of almost any type by lobotomy. In my experience, many patients who have been operated on for relief of chronic pain have thereafter relaxed and have given up the struggle for existence. I have had no experience with unilateral lobotomy. I have had some experience with trans-orbital lobotomy, which is not particularly satisfactory as yet. It is interesting that these patients, after lobotomy, respond more vigorously and actively to pain than they did before operation. That seems to indicate that frontal lobotomy has the effect of preventing the continuous contemplation of pain, the prolonged attention given to pain, which is so common in cases of severe pain. Pain seems to be of only momentary importance. It carries neither the forward-looking significance of death and disability nor the reverberations that occur following a distressing experience. These must belong to the emotional aspects of the pain phenomenon and, when the emotion is done away with, then pain either becomes no longer significant or actually disappears. In a good many cases it just disappears.

DR. R. P. MACKAY, Chicago: One of the justifications of the old-fashioned introspective psychology was that it taught something about subjective experiences which can be obtained in no other way. It taught that pain is almost unique among subjective sensations and experiences because it is accompanied with a particular degree of affect which might be summarized by the term "unpleasantness." Most of the work that has been done on frontal lobotomy for pain has tended to show, as does the work presented so ably here, that it is not pain which is abolished but the unpleasant emotional aspect. The interference with pain experience that results from lobotomy or cortical ablation consists largely of the abolition of affect. This is consistent with what is known about the phylogenesis of the nervous system. Pain, perhaps the most primitive of all sensations, has apparently little cortical representation, whereas discriminatory sensation, position sense, weight perception and so on, being later acquired, have cortical representation. The work that has been presented here shows—and it is important that one remember it from a physiologic point of view—that operation on the frontal lobe does not abolish or interfere with pain as a sensation, but it does apparently abolish a great deal of the affective component.

DR. JOHN B. DYNES: Dr. Koskoff was a little critical of the rigorous method of selecting patients for lobotomy. I feel that we should continue to be rigorous in our selection of patients for lobotomy, particularly in view of the fact that it is the last thing we can do, and certainly with patients in the younger age group who have had intractable pain for many years I think it would be foolhardy to operate before every other type of treatment has been exhausted. I believe, in patients with metastatic malignant disease, in patients dying of cancer, that one may be less rigorous, but even in those cases I think that one should be careful about explaining the situation to the family, who must realize that the patient is going to have a personality alteration. They must likewise realize that it is not an operation to save the patient's life. It is only an operation to aid in his future care and the relief of pain. If the patient has only a few weeks to live, I think that frequently medication will do just as well, but if the patient has many months to live or possibly a year or two, lobotomy does offer something very definite for the relief of intractable pain. My co-workers and I have had some experience with unilateral lobotomy and to date have not been favorably impressed. We have been aware of Dr. Koskoff's work in that field, and we wished to try it. I do not believe that there is anything definitely in favor of operating on the dominant frontal lobe. There is no evidence in our cases in which unilateral lobotomy was done that that procedure worked out. Operation on what was thought to be the dominant hemisphere was unsuccessful. Our experience in doing unilateral lobotomy is very limited. We finally changed to operation on both sides, and the results were successful. We would not condemn unilateral lobotomy until we have had further experience. Dr. Chapman's remarks are a bit disquieting. One wonders why the patient does gain relief from pain when actually there seems to be even more reaction to cutaneous stimuli. I suppose that Dr. Freeman's and Dr. Mackay's remarks likewise apply here and perhaps are the explanation I could offer for that seemingly increased reaction to maintained stimuli, but a general response with lessening of pain generally. Dr. Koskoff asked about addiction to drugs and stated that in his series there were no patients who had withdrawal reactions after lobotomy. That is an important problem, I think perhaps physiologically as well as with respect to this operation. I cannot say, however, that we had patients who did not have drug withdrawal reactions. We had patients who had typical symptoms of drug withdrawal—tachycardia, increased respiration, shock and all the other phenomena that would make one feel that they were having withdrawal reactions, and in turn those withdrawal reactions were relieved by administration of narcotics for a brief period and, finally, gradually withdrawing them.

Ulcer of the Greater Curvature.—The location of an ulcerative lesion in the stomach is one of the most reliable guides in deciding on the probability of its being benign or malignant. The hazards of conservative treatment in this regard have been fairly well determined. This is especially true in lesions of the greater curvature which are nearly always malignant. . . . In the experience of the Massachusetts General Hospital, lesions of the greater curvature are malignant in 100 per cent, of the prepyloric area in 65 per cent, and of the anterior and posterior walls in 20 per cent, of the pylorus in 10 per cent. Similar figures are reported from the Mayo Clinic. Wiley in his review on gastric ulcer has found prepyloric ulcer variously reported as 75 to 83 per cent malignant.

The rarity of benign ulcers of the greater curvature is attested to in general terms by Kirklin, Palmer, Templeton and Bockus. . . . Lahey has never seen a benign ulceration of the greater curvature. Sproul's communications with leading roentgenologists in 1931 showed not one who had a histologically confirmed diagnosis of benign greater curvature ulcer. He . . . could find only 10 histologically proved cases in the literature up to 1928. Holmes and Hampton cite Orator's study of 330 cases of gastric ulcer from Eiselberg's clinic without a single benign ulcer of the greater curvature.—Kennedy, G. R., and Beck, Erwin, *The American Journal of Surgery*, October 1948.

Clinical Notes, Suggestions and New Instruments

TAP WATER SODIUM IN THE LOW SALT DIET

SEYMOUR L. COLE, M.D.
Los Angeles

The sodium content of the food in the daily diet has become recognized as an important factor in the salt and water balance of persons with heart failure, hypertension and renal disease.¹ With the exception of occasional casual mention,² however, drinking water has been overlooked as a source of sodium large enough to nullify attempts to restrict that element in the solid part of the diet. Furstenberg and his associates³ reported drinking water of high sodium content to be the cause of failure of a low salt diet in the treatment of Ménéière's disease. This they corrected by substituting water of low sodium content. Lenel, Katz and Rodbard^{3a} varied the blood pressure of laboratory animals with changes in the sodium content of the drinking water.

The purpose of this paper is to emphasize that the determination of the sodium content of the water supply of a community is an essential part in the establishment of a low salt regimen.

Chemical analyses of public water supplies are on record and additional data can be obtained from the various state and municipal laboratories. The sodium content of the water must not be ignored when it is more than 10 mg. per hundred cubic centimeters,⁴ as in Aberdeen, S. D.; Biloxi, Miss.; Crandall, Galveston and Houston, Texas; Galesburg, Ill.; Kansas City and Nevada, Mo.; Los Angeles; Marion, Ohio; Minot, N. D.; Oklahoma City, and Phoenix, Ariz.

SODIUM IN THE PUBLIC WATER SUPPLY OF LOS ANGELES

This is illustrated by a study of the drinking water of the city of Los Angeles.⁵ There are three main sources of supply,⁶ the Owens River and Valley Aqueduct, with a sodium content of 47 parts per million (p.p.m.), the Los Angeles River, with a sodium content of 55 p.p.m., and the Colorado River (Metropolitan Water District) with a sodium content of 194 p.p.m. These are averages for the fiscal year 1946-1947. A maximum deviation of 25 per cent from the average may be expected during the year. The sodium content in milligrams per hundred cubic centimeters may be obtained by dividing parts per million by 10.

Since water from any one of the three sources is distributed through the same pipes to all parts of the city, depending on the season and peak water demands, the source of highest sodium content should be the basis for dietary calculations.

Read by title before the Western Society for Clinical Research, Oct. 22, 1948.

From the Los Angeles County Hospital and the Department of Medicine of the University of Southern California School of Medicine.

Determinations of the sodium content of tap water at the Los Angeles County Hospital were done by Dr. D. G. Simonsen, chemist. Estimations of hidden water and sodium in the low salt diets were done by Lillian J. Emoff, consulting dietician.

6. California Water Supply Statistics, Bulletin 63, State of California Department of Public Health, 1941. Footnote 5.

Therefore, the figures in this paper are based on samples from the Metropolitan Water District.

Besides its natural high sodium content, the Colorado River water contains large amounts of calcium and magnesium which make it "hard."⁷ To counteract this, an average of more than 3,660 tons (3,320 metric tons) of salt per month is added to the Colorado River from the softening plant of the Metropolitan Water District at La Verne, Calif. This raises the sodium content by an average of 86 p.p.m., or 8.6 mg. per hundred cubic centimeters.⁷

The sodium content of the water may be further increased by the softening processes in the various institutions in which it is used. In the Los Angeles County Hospital the water contained 20 mg. of sodium per hundred cubic centimeters before softening and 26 mg. of sodium when it came out of the softening process. (These determinations were made by the flame photometer method.) On another occasion, the cold tap water had a sodium content of 25 mg.; a sample from the adjacent hot water faucet had a sodium content of 30 mg. per hundred cubic centimeters. This is a factor to be considered when water is heated for any purpose in the preparation of food for patients with hypertension, renal disease and heart failure.

EFFECT ON LOW SALT DIETS

The table shows the effect of the use of water with a sodium content of 25 mg. on representative low salt diets. It gives the ranges of daily sodium and fluid intakes permitted by the various authors.

The Effect of the Use of Tap Water with a Sodium Content of 25 Mg. per Hundred Cubic Centimeters in the Low Salt Diets of Schroeder, Schemm and Kempner

	Diet: Sodium, Gm.	Fluid, Cc.		Sodium from Fluid, Gm.		
		In- take	Hidden	In- take	Hidden	Total
Schroeder ^{1a}	0.500 to 1.000	3,000	300	0.750	0.075	0.825
Schemm ^{1c}						
Initial.....	0.850	3,000	780	0.750	0.175	0.925
Neutral.....	0.850	5,000 to 10,000	780	1.250 2,500	0.175	1.425 2.675
Kempner (rice) ^{1d}	0.200	1,000	600	0.250	0.150	0.400

The water used in cooking rice and other vegetables and foods is estimated and represented by the figures for hidden fluid.

The last column shows the sum total of the sodium derived from drinking and hidden water. In Schroeder's diet, it exceeds the minimum and approaches the maximum sodium permitted. In the Schemm and Kempner diets, the sodium from fluid sources is greater than the total sodium allowed for the entire diet.

Thus, the high sodium content of drinking water may account for the failure of low salt diets in the treatment of some patients with hypertension and heart failure in Los Angeles and other areas with water of similar salinity. To avoid this situation, tap water of high sodium content should be replaced by distilled or deionized water of low sodium content for all oral needs of such patients.

SUMMARY

This paper emphasizes the importance of studying the sodium content of tap water in the establishment of a low salt diet in the treatment of high blood pressure, heart failure and renal disease.

The tap water of an institution is described and the factors contributing to its high sodium content are discussed. The effect of the use of such water on representative low salt diets is illustrated.

It is suggested that substitution of distilled, deionized or spring water of low sodium content for tap water of high sodium content is a necessary precaution to insure the success of a low salt diet.

6333 Wilshire Boulevard (36).

Council on Foods and Nutrition

The following product has been accepted as conforming to the Rules of the Council.

JAMES R. WILSON, M.D., *Secretary.*

The H. J. Heinz Company, Pittsburgh

HEINZ STRAINED CHICKEN SOUP consists of chicken, carrots, celery, onions, egg noodles, salt, cream, milk, brewers' yeast, wheat flour and water to prepare.

Analysis (submitted by manufacturer).—Total solids 11.60 per cent, total sugar as sucrose 0.96 per cent, acidity, as lactic 0.12 per cent, protein (N $\times$ 6.25) 2.38 per cent, fat (by acid hydrolysis) 3.33 per cent, crude fiber 0.16 per cent, ash 1.05 per cent, total carbohydrates (by difference) 4.68 per cent.

Calories.—0.6 per gram; 16.4 per ounce.

Vitamins and Minerals

	Per Hundred Grams
Vitamin A	230 I.U.
Thiamine	0.018 mg.
Riboflavin	0.060 mg.
Niacin	0.590 mg.
Calcium	27.0 mg.
Phosphorus	42.0 mg.
Iron	0.1 mg.
Copper	0.09 mg.
Salt	920.0 mg.

Use.—For use in the feeding of infants, convalescents and others requiring a soft diet.

HEINZ STRAINED VEGETABLES AND BACON WITH CEREAL consists of carrots, potatoes, celery, tomato solids, bacon, wheat flour, onions, farina, salt and brewers' yeast.

Analysis (submitted by manufacturer).—Total solids 12.44 per cent, total sugar as sucrose 0.94 per cent, protein (N $\times$ 6.25) 1.28 per cent, fat (by acid hydrolysis) 2.98 per cent, crude fiber 0.35 per cent, ash 1.13 per cent, total carbohydrates (by difference) 6.66 per cent.

Calories.—0.59 per gram; 16.7 per ounce.

Vitamins and Minerals

	Per Hundred Grams
Vitamin A	1,375 I.U.
Thiamine	0.114 mg.
Riboflavin	0.057 mg.
Ascorbic acid	0.10 mg.
Niacin	0.478 mg.
Calcium	12.00 mg.
Phosphorus	20.00 mg.
Iron	0.32 mg.
Copper	0.06 mg.
Salt	880.00 mg.

Use.—For use in the feeding of infants, convalescents and others requiring a soft diet.

HEINZ STRAINED SQUASH consists of steamed, peeled and trimmed Boston marrow or pink banana squash, sugar and salt.

Analysis (submitted by manufacturer).—Total solids 8.35 per cent, total sugar as sucrose 3.46 per cent, acidity, as citric 0.21 per cent, protein (N $\times$ 6.25) 0.84 per cent, fat (by acid hydrolysis) 0.06 per cent, crude fiber 0.74 per cent, ash 1.09 per cent, total carbohydrates (by difference) 5.41 per cent.

Calories.—0.26 per gram; 7.3 per ounce.

Vitamins and Minerals

	Per Hundred Grams
Vitamin A	1,200 I.U.
Thiamine	0.008 mg.
Riboflavin	0.026 mg.
Niacin	0.224 mg.
Ascorbic acid	1.20 mg.
Calcium	29.00 mg.
Phosphorus	37.00 mg.
Iron	0.32 mg.
Copper	0.08 mg.
Salt	540.00 mg.

Use.—For use in the feeding of infants, convalescents and others requiring a soft diet.

HEINZ STRAINED PLUMS WITH FARINA consists of pitted Italian type plums, sugar, farina and water to prepare.

Analysis (submitted by manufacturer).—Total solids 27.78 per cent, total sugar as sucrose 17.93 per cent, acidity, as citric 0.51 per cent, protein (N $\times$ 5.7) 0.82 per cent, fat (by acid hydrolysis) 0.70 per cent, crude fiber 0.22 per cent, ash 0.40 per cent, total carbohydrates (by difference) 25.13 per cent.

Calories.—1.09 per gram; 30.9 per ounce.

Vitamins and Minerals

	Per Hundred Grams
Vitamin A	330 I.U.
Thiamine	0.020 mg.
Riboflavin	0.012 mg.
Niacin	0.32 mg.
Ascorbic acid	2.2 mg.
Calcium	11.0 mg.
Phosphorus	16.0 mg.
Iron	0.7 mg.
Copper	0.08 mg.
Salt	60.00 mg.

Use.—For use in the feeding of infants, convalescents and others requiring a soft diet.

Council on Pharmacy and Chemistry

NEW AND NONOFFICIAL REMEDIES

The following additional articles have been accepted as conforming to the rules of the Council on Pharmacy and Chemistry of the American Medical Association for admission to *New and Nonofficial Remedies*. A copy of the rules on which the Council bases its action will be sent on application.

AUSTIN SMITH, M.D., Secretary.

SULFADIAZINE-SULFAMERAZINE COMBINED.

—Mer-Diazine-McNeil.—A mixture of equal parts of sulfadiazine and sulfamerazine to which there may or may not be added a suitable compatible agent to increase the μ of the urine.

Actions and Uses.—The combination of equal parts of sulfamerazine and sulfadiazine has been shown to provide approximately the same therapeutic activity that is obtained when either drug is administered singly in doses equal to the sum of the two. Comparable total sulfonamide blood levels are thus produced with the same doses of the mixture as for either drug given alone. Because each of the component sulfonamides has its own distinct urinary solubility, the combination which contains only half the usual therapeutic dose of each drug is also potentially less toxic and less liable to be accompanied by crystal deposition from the urine. It has been demonstrated that the incidence of renal crystalluria is reduced to about the same extent as it would be by the administration of 12 Gm. of sodium bicarbonate per day with therapeutic doses of either sulfonamide alone. The simultaneous administration of a urinary alkali with the mixture of sulfonamides, still further reduces the tendency of the drug to crystallize out and form deposits in the kidney, although less alkali is required than when the drugs are given singly. It should be emphasized however, that because of the closely similar chemical structure of the two drugs, the incidence of drug sensitivity and other toxic manifestations of sulfonamide therapy is considered to be about the same for the mixture as for either drug alone.

Dosage.—The dosage of total sulfonamides represented by the mixture should be not less nor more than is recommended for the therapeutic use of the constituent sulfonamides singly. See statements under Sulfadiazine and Sulfamerazine. The use of a lower total sulfonamide dose than the single recommended dose would not be therapeutically effective; the use of a higher total dose than customary for the drug given singly would defeat the purpose of the mixture.

Tests and Standards.—

The sulfadiazine and sulfamerazine used in the manufacture of Sulfadiazine-Sulfamerazine Combined respond to the tests and assays given for these substances in the U. S. Pharmacopoeia.

SULFADIAZINE-SULFAMERAZINE COMBINED, LIQUID SUSPENSION: This preparation is a thick, creamy, stable, liquid suspension.

Determine the total sulfonamides present in a 5 cc. aliquot of the suspension by the diazotization-titration described in the assay for Sulfadiazine in U. S. P. XIII, p 526. Each cc. of tenth-normal sodium nitrite is equivalent to 0.02573 Gm. of sulfadiazine-sulfamerazine combined; the total sulfonamides present should not be less than 95.0 nor more than 105.0 per cent of the labeled amount.

MCNEIL LABORATORIES, INC., PHILADELPHIA 32

Liquoid Mer-Diazine: 120 cc. and 480 cc. bottles. A suspension containing 1.5 Gm. sulfamerazine and 1.5 Gm. sulfadiazine per 30 cc. solution.

ZINCUNDECATE.—"Desenex"—Wallace & Tiernan.—A preparation containing as its active ingredients undecylenic acid and zinc undecylenate. Their structural formulas may be represented as follows:

Actions and Uses.—Zincundecate is proposed for use in superficial dermatomycosis, including epidermatosis inguinale, tinea pedis, otomycosis, moniliasis, tinea corporis and tinea versicolor.

Dosage.—Apply twice daily, preferably using the ointment at night, and with ambulatory patients, the powder during the day.

Tests and Standards.—

UNDECYLENIC ACID.—10-hendecenoic acid.—10 undecenoic acid.— $\text{C}_{11}\text{H}_{20}\text{O}_2$ —M. W. 184.27.

Undecylenic acid occurs as a yellow liquid with a characteristic odor. It is practically insoluble in water and very soluble in alcohol. The refractive index at 25 C. is about 1.4486. The specific gravity of undecylenic acid at 25 C. is about 0.9110.

Add potassium permanganate T.S. dropwise to about 1 cc. of undecylenic acid: the permanganate color is discharged.

Add bromine water T.S. dropwise to about 1 cc. of undecylenic acid: the bromine color is discharged rapidly.

Add 1 cc. of aniline to 1 cc. of undecylenic acid and reflux for 1 hour. Cool and add 5 cc. of alcohol to the mixture and then 5 cc. of ether. Wash the ether with four 20 cc. portions of water. Evaporate the solution to dryness and recrystallize the residue from benzene: the product melts in the range 67.0-67.5 C.

Shake 1 cc. of undecylenic acid with 20 cc. of water and then separate the solution. Add 5 drops of silver nitrate T.S. to the aqueous portion: no turbidity appears.

Shake 1 cc. of undecylenic acid with 10 cc. of water and then separate the layers. Add 1 cc. of barium chloride T.S. to the aqueous layer: no turbidity develops.

Shake 5 cc. of undecylenic acid with 5 cc. of water and filter through a moistened paper. Add 1 drop of methyl orange T.S. to the solution and titrate with 0.1 N sodium hydroxide: no more than 0.1 cc. of 0.1 N sodium hydroxide is necessary to bring the color to that corresponding to 1 drop of methyl orange in 5 cc. of water.

Boil 1 cc. of undecylenic acid with 0.5 Gm. of sodium carbonate in 30 cc. of water: no more than a very slight opalescence appears in the hot solution.

Ash about 1 Gm. of undecylenic acid: the residue does not exceed 0.15 per cent of the weight of the original substance.

Determine the heavy metal content according to the U.S.P. XIII, p. 657: the heavy metal content does not exceed 10 ppm.

Determine the iodine value of undecylenic acid according to the U.S.P. XIII, p. 647: the iodine value is not less than 131 nor more than 138.

Weigh, accurately, about 0.5 Gm. of undecylenic acid. Titrate the acid with 0.1 N potassium hydroxide. Each cc. of 0.1 N potassium hydroxide is equivalent to 0.018427 Gm. of undecylenic acid: the undecylenic acid content is not less than 95 nor more than 108 per cent of the weighed amount.

ZINC UNDECYLENATE.—The zinc salt of undecylenic acid.— $\text{C}_{22}\text{H}_{40}\text{O}_2\text{Zn}$.—M. W. 431.90.

Zinc undecylenate occurs as a very fine white powder. It is practically insoluble in alcohol and in water.

Dissolve about 0.1 Gm. of zinc undecylenate in 10 cc. of water by adding 1 cc. of strong ammonia solution. Add sodium sulfide T.S.: a white flocculent precipitate develops.

Acidify about 0.1 Gm. of zinc undecylenate with 10 cc. of sulfuric acid. Extract the solution with two 25 cc. portions of ether. Wash the ether solution with 3 successive 25 cc. portions of water. Evaporate the ether on a steam bath. The residue responds to the tests described in the monograph on Undecylenic Acid-N.N.R.

Weigh, accurately, about 0.1 Gm. of zinc undecylenate. Dry it at 105 C. for 2 hours: the loss in weight does not exceed 1.25 per cent.

Boil 1.5 Gm. of zinc undecylenate with 50 cc. of water and 10 cc. of hydrochloric acid. Filter the hot solution and wash the residue with about 50 cc. of hot water. Make the combined filtrate and washings alkaline with ammonia T.S. and add ammonium sulfide T.S. to precipitate the zinc completely. Dilute to 200 cc., mix, and filter. Add 0.5 cc. of sulfuric acid to 100 cc. of the clear filtrate. Evaporate to dryness and ignite to constant weight in a muffle furnace at 500 to 700 C.: the weight of the residue does not exceed 7.5 mg.

Weigh, accurately, about 0.25 Gm. of zinc undecylenate in a tared crucible and ash the sample over a low flame to constant weight. Each 0.1 Gm. of ash is equivalent to 0.531 Gm. of zinc undecylenate: the zinc undecylenate content is not less than 98 nor more than 102 per cent of the dry sample.

WALLACE & TIERNAN PRODUCTS, INC., BELLEVILLE, N. J.

Desenex (Powder): 45 Gm. sifter containers and 454 Gm. jars. A fungicidal powder containing zinc undecylenate 20%, undecylenic acid 2% and talc U.S.P. 78%.

Ointment Desenex: 30 Gm. tubes and 454 Gm. jars. A fungicidal ointment containing zinc undecylenate 20%, undecylenic acid 5% in a water-miscible base q.s.

U. S. trademark registered.

DIPHThERIA TOXOID, ALUM PRECIPITATED.—U.S.P. (See New and Nonofficial Remedies 1948, p. 497).

CUTTER LABORATORIES, BERKELEY, CALIF.

Diphtheria Toxoid Aluminum Hydroxide Adsorbed (Alhydrox): 10 cc. and two 1 cc. and 10 cc. vials. Each cc. contains the required amount of diphtheria toxoid. Preserved with sodium ethylmercurithiosalicylate 1:10,000.

DIETHYLSTILBESTROL-U.S.P. (See New and Nonofficial Remedies 1948, p. 378).

The following dosage form has been accepted:

AMERICAN PHARMACEUTICAL COMPANY, NEW YORK

Tablets Diethylstilbestrol: 0.5 mg., 1 mg. and 5 mg.

PERTUSSIS VACCINE COMBINED WITH DIPHThERIA TOXOID (See New and Nonofficial Remedies 1948, p. 507).

CUTTER LABORATORIES, BERKELEY, CALIF.

Diphtheria Toxoid and Pertussis Vaccine Combined (Diptussis): 2.5 cc. and 10 cc. vials. Each cc. contains 40,000 million *H. pertussis* phase I and the required amount of diphtheria toxoid. Preserved with sodium ethylmercurithiosalicylate 1:10,000.

Diphtheria Toxoid Aluminum Hydroxide Adsorbed and Pertussis Vaccine Combined (Diptussis Alhydrox): 1 cc.

and packages of two 1 cc. vials. Each cc. contains 20,000 million *H. pertussis* phase I and the required amount of diphtheria toxoid aluminum hydroxide adsorbed. Preserved with sodium ethylmercurithiosalicylate 1:10,000.

PERTUSSIS VACCINE COMBINED WITH DIPHTHERIA AND TETANUS TOXOIDS (See New and Nonofficial Remedies 1948, p. 508).

CUTTER LABORATORIES, BERKELEY, CALIF.

Diphtheria and Tetanus Toxoid and Pertussis Vaccine Combined (Dip-Pert-Tet): 2.5 cc. and 10 cc. vials. Each cc. contains the required amount of both diphtheria and tetanus toxoids plus 40,000 million *H. pertussis* phase I. Preserved with sodium ethylmercurithiosalicylate 1:10,000.

Diphtheria and Tetanus Toxoid Aluminum Hydroxide Adsorbed and Pertussis Vaccine Combined (Dip-Pert-Tet Alhydrox): Two 1 cc. vials and 10 cc. vials. Each cc. contains the required amount of diphtheria and tetanus toxoids plus 20,000 million *H. pertussis* phase I. Preserved with sodium ethylmercurithiosalicylate 1:10,000.

SODIUM FOLATE.—**Sodium Folvite-Lederle.**—Sodium pteroylglutamate. — Sodium N - [4 - { (2 - amino - 4 - hydroxy - 6 - pteridyl) methyl} - amino } benzoyl] glutamate - $C_{19}H_{17}N_7NaO_6$. M.W. 463.4.—Sodium folate is made by dissolving folic acid in dilute sodium hydroxide. The salt is not isolated from the solution. The structural formula of sodium folate may be represented as follows:

Actions and Uses.—Sodium folate possesses the activity of folic acid and is preferred when parenteral therapy is indicated.

Dosage.—Same as for folic acid. (See N. N. R. 1948, p. 558).

Tests and Standards.—

The folic acid used in preparing sodium folate solution responds to the tests and assay given in the monograph for Folic Acid-N.N.R.

SODIUM FOLATE SOLUTION: The solution is a clear, mobile liquid, yellow to orange-yellow in color. In a concentration equivalent to 15 mg. of folic acid per cc., the solution has a pH between 8.5 and 11.0.

Sodium folate solution is assayed spectrophotometrically. Prepare a standard curve as directed in the monograph for folic acid starting with "Place about 0.1 Gm. of *para*-aminobenzoic acid . . ." Then, by means of a pipette, accurately measure into a 100 cc. volumetric flask sufficient sodium folate solution to contain about 0.1 Gm. of folic acid, dilute to the mark with tenth-normal sodium hydroxide, and proceed with the assay as directed in the folic acid monograph, starting with "Transfer 1 cc. of the solution to a 100 cc. volumetric flask and add 80 cc. of water, 10 cc. of five normal hydrochloric acid . . ." The sodium folate content corresponds to a folic acid concentration of not less than 90 nor more than 115 per cent of the labeled amount.

KREMERS-URBAN COMPANY, MILWAUKEE 1

Solution Sodium Folate: 15 mg. per cc., 1 cc. ampuls.

AMINOPHYLLINE-U. S. P. (See New and Nonofficial Remedies 1948, p. 325).

The following dosage forms have been accepted:

BREWER & COMPANY, INC., WORCESTER 8, MASS.

Tablets Aminophylline: 0.1 Gm. and 0.2 Gm.

BUFFINGTON'S, INC., WORCESTER, MASS.

Tablets Aminophylline: 0.1 Gm. and 0.2 Gm.

Solution Aminophylline: 0.5 Gm., 2 cc. and 20 cc. ampuloids and 0.25 Gm., 10 cc. ampuloids.

ESTROGENIC SUBSTANCES (WATER INSOLUBLE) (See New and Nonofficial Remedies 1948, p. 370).

The following dosage form has been accepted:

THE SMITH-DORSEY COMPANY, LINCOLN, NEB.

Aqueous Suspension Estrogenic Substances: 10,000 I. U. per cc., 1 cc. ampuls and 10 cc. vials; 50,000 I. U. per cc., 10 cc. vials. Preserved with carbolic acid 0.5 per cent.

TETANUS TOXOID, ALUM PRECIPITATED-U.S.P. (See New and Nonofficial Remedies 1948, p. 501).

CUTTER LABORATORIES, BERKELEY, CALIF.

Tetanus Toxoid Aluminum Hydroxide Adsorbed (Alhydrox): Two 1 cc. vials and 10 cc. vial. Each cc. contains the required amount of tetanus toxoid. Preserved with sodium ethylmercurithiosalicylate 1:10,000.

MUCIN-ALUMINUM HYDROXIDE-MAGNESIUM TRISILICATE.—"Mucotin"—Harrower.—An antacid mixture of gastric mucin, dried aluminum hydroxide gel, U.S.P. ($Al_2O_3 \cdot xH_2O$), and magnesium trisilicate, U.S.P. ($2MgO \cdot 3SiO_2 \cdot xH_2O$), containing the labeled amounts of these ingredients.

Actions and Uses.—A mixture of histamine-free gastric mucin, aluminum hydroxide and magnesium trisilicate has been found to be an effective combination for oral administration in the control of symptomatic gastric hyperacidity and as an adjunct in the treatment of peptic ulcer. Gastric mucin has been shown to impart to the mixture a more distinct protective coating effect on the gastric mucosa than can be demonstrated with the use of antacids alone. Gastroscopic studies indicate that the mucin-antacid combination definitely coats the ulcer crater and may remain in the stomach for over an hour after instillation of the mixture. The antacid effect of the rapidly reacting aluminum hydroxide and the more slowly but prolonged reacting magnesium trisilicate, imparts to the mixture the advantages of both these antacids. The presence of magnesium trisilicate is also believed to counteract the constipating effect of the aluminum hydroxide but the available evidence on this point is not conclusive.

Dosage.—There is as yet no definite evidence by which to determine the optimum exact proportions of the antacids to be used in the mixture, but observations thus far indicate that best results are obtained with preparations containing approximately 10 per cent of gastric mucin. A ratio of 1:1.5:2.75 for gastric mucin-aluminum hydroxide-magnesium trisilicate has been found to give good results. A tablet preparation of these proportions containing gastric mucin 0.16 Gm., dried aluminum hydroxide gel 0.25 Gm. and magnesium trisilicate 0.45 Gm. is recommended in doses of two tablets every 2 hours. The tablets should be well chewed and no fluids taken during the following half hour.

Tests and Standards.—

MUCIN-ALUMINUM HYDROXIDE-MAGNESIUM TRISILICATE TABLETS: These tablets are light cream-colored.

Accurately weigh 25 tablets and grind them to a fine powder. Weigh a portion of powder equivalent to 1 tablet and transfer it to a 250 cc. flask. Add exactly 100 cc. of 0.1 N hydrochloric acid and keep the flask at 37.5 C. for 1 hour, shaking or stirring the mixture continuously during this time. Titrate the excess acid with 0.1 N sodium hydroxide using bromophenol blue T.S.; the volume of 0.1 N hydrochloric acid consumed is not less than 75 cc. for 1 tablet weighing about 1.25 Gm.

Accurately weigh a portion of mucin-aluminum hydroxide-magnesium trisilicate powder equivalent to 3 tablets and determine its nitrogen content according to *Official and Tentative Methods of Analysis of the Association of Agricultural Chemists*, 6th ed., p. 25; each tablet contains not less than 7.0 nor more than 9.0 per cent of the labeled amount of gastric mucin.

Accurately weigh into a platinum crucible a portion of mucin-aluminum hydroxide-magnesium trisilicate powder, equivalent to 1 tablet, add 2 Gm. of anhydrous sodium carbonate and 4 Gm. of anhydrous potassium carbonate, and carefully mix. Ignite at 500 C. for 1 hour and then ignite carefully over a Meker burner until fusion is complete and practically no carbon remains. Cool the crucible, leach the fused mass with about 50 cc. of water, heating if necessary, and transfer solution and residue to a 250 cc. beaker. Slowly add 25 cc. of concentrated hydrochloric acid. Evaporate the solution to dryness on a steam bath, then heat at 100 C. for 2 hours. Treat the residue with 2 cc. of hydrochloric acid and 50 cc. of water, heat to boiling, cool, transfer the solution and insoluble matter to a 250 cc. volumetric flask, make up the solution to the mark, and mix thoroughly. Filter the solution through a No. 42 Whatman paper, rejecting the first 15 cc. of filtrate and saving the precipitate for the silica determination described later. Transfer exactly 100 cc. of the filtrate to a 250 cc. beaker and proceed with the assay for aluminum oxide as directed in U.S.P. XIII, p. 27, in the monograph on Dried Aluminum Hydroxide Gel, beginning with the words, ". . . add 3 drops of methyl red T.S. . . ." Save the filtrate and washings for the magnesium determination described later. The amount of aluminum oxide is not less than 45.0 nor more than 55.0 per cent of the labeled amount of dried aluminum hydroxide gel.

To the combined filtrate and washings saved for the magnesium determination, add 1 Gm. of dibasic ammonium phosphate ($(NH_4)_2HPO_4$) and then add 2 cc. of ammonia T.S., dropwise and with constant stirring; a crystalline precipitate forms. Allow the mixture to stand for 15 minutes, add 15 cc. of strong ammonia solution, let the mixture stand 4 hours or overnight, and transfer the precipitate to a tared Gooch crucible and wash it with two 5 cc. portions of 1.4 per cent ammonium hydroxide solution. Dry the crucible at 100 C. and ignite to constant weight over a Meker burner, cool and weigh the magnesium oxide formed: the amount of magnesium oxide is not less than 18.0 nor more than 22.0 per cent of the labeled amount of magnesium trisilicate.

Transfer the filter paper containing the precipitate saved from the aluminum oxide determination to a tared platinum crucible and proceed with the assay for silica as directed in U.S.P. XIII, p. 300, in the monograph on Magnesium Trisilicate, beginning with the words, "Heat to dryness . . ." The amount of silicon dioxide is not less than 40.5 nor more than 49.5 per cent of the labeled amount of magnesium trisilicate.

THE HARROWER LABORATORY, INC., GLENDALE 5, CALIF.

Tablets Mucotin: Each tablet contains gastric mucin 0.16 Gm., dried aluminum hydroxide gel 0.25 Gm. and magnesium trisilicate 0.45 Gm.

U. S. patent applied for Lutheran Univ. Assn. (Valparaiso University); U. S. trademark 519,949.

The present Annual Report on Hospital Service in the United States for 1948 is based on information received from individual hospitals registered by the American Medical Association. Uniformity in reporting is accomplished through the distribution of annual census blanks prepared by the Council on Medical Education and Hospitals in collaboration with the American College of Surgeons. These forms are sent to all registered hospitals, which in turn supply information either for the calendar year or for the latest twelve month period for which statistics are available. As in previous years the active participation and response of nearly 98 per cent of all registered hos-

ties, the hospitals accredited by the American College of Surgeons as meeting unconditionally its requirements for general standardization, and hospitals conducting schools of nursing education accredited by the respective State Boards of Nurse Examiners; (3) statistical tables and textual material giving detailed information by states on the number, size and classification of hospitals, bed capacity, percentage occupancy, number of births, patients admitted, average daily census and total patient days; (4) a survey of professional and auxiliary nursing personnel in hospitals, schools of nursing education and student enrolment; (5) lists and other information on technical schools approved by the Council

SUMMARY OF HOSPITAL DATA—1948

pitals is continued evidence of the excellent cooperation which the American Medical Association receives in the hospital field. For this generous support the Council on Medical Education and Hospitals wishes to extend its appreciation to each individual hospital, to the medical departments of the United States Army, United States Air Force, United States Navy, United States Public Health Service, Veterans Administration, the Federal Security Agency and to all other organizations and persons who have helped to make possible the preparation of this report.

The current report for 1948 presents (1) a complete list of all hospitals in the United States, territories and possessions that have been registered by the American Medical Association in accordance with standards adopted by the Council on Medical Education and Hospitals; (2) a further designation by symbols of those hospitals approved by the American Medical Association for internships and residencies in special-

on Medical Education and Hospitals in the fields of medical technology, x-ray technic, physical therapy, occupational therapy and medical record library science; (6) a survey of the use of medical motion pictures in hospitals, and (7) studies on specialty certification in relation to hospital staff appointments, and the establishment of general practice sections in hospitals.

While internship and residency hospitals are shown in the present issue, a separate listing of approved internships and residencies with additional information on hospital educational services will appear in THE JOURNAL, May 14, 1949.

Scope of Survey

All hospitals registered by the American Medical Association are represented in the present report. Included in the registered list are (1) civilian hospitals in the United States; (2) hospital services maintained

and packages of two 1 cc. vials. Each cc. contains 20,000 million *H. pertussis* phase I and the required amount of diphtheria toxoid aluminum hydroxide adsorbed. Preserved with sodium ethylmercurithiosalicylate 1:10,000.

PERTUSSIS VACCINE COMBINED WITH DIPHTHERIA AND TETANUS TOXOIDS (See New and Nonofficial Remedies 1948, p. 508).

CUTTER LABORATORIES, BERKELEY, CALIF.

Diphtheria and Tetanus Toxoid and Pertussis Vaccine Combined (Dip-Pert-Tet): 2.5 cc. and 10 cc. vials. Each cc. contains the required amount of both diphtheria and tetanus toxoids plus 40,000 million *H. pertussis* phase I. Preserved with sodium ethylmercurithiosalicylate 1:10,000.

Diphtheria and Tetanus Toxoid Aluminum Hydroxide Adsorbed and Pertussis Vaccine Combined (Dip-Pert-Tet Alhydrox): Two 1 cc. vials and 10 cc. vials. Each cc. contains the required amount of diphtheria and tetanus toxoids plus 20,000 million *H. pertussis* phase I. Preserved with sodium ethylmercurithiosalicylate 1:10,000.

SODIUM FOLATE.—Sodium Folvite-Lederle.—Sodium pteroylglutamate. — Sodium N - [4 - { (2 - amino - 4 - hydroxy - 6 - pteridyl) methyl } - amino } benzoyl] glutamate- $C_{10}H_{14}N_7NaO_4$. M.W.-463.4.—Sodium folate is made by dissolving folic acid in dilute sodium hydroxide. The salt is not isolated from the solution. The structural formula of sodium folate may be represented as follows:

Actions and Uses.—Sodium folate possesses the activity of folic acid and is preferred when parenteral therapy is indicated.

Dosage.—Same as for folic acid. (See N. N. R. 1948, p. 558).

Tests and Standards.—

The folic acid used in preparing sodium folate solution responds to the tests and assay given in the monograph for Folic Acid-N.N.R.

SODIUM FOLATE SOLUTION: The solution is a clear, mobile liquid, yellow to orange-yellow in color. In a concentration equivalent to 15 mg. of folic acid per cc., the solution has a pH between 8.5 and 11.0.

Sodium folate solution is assayed spectrophotometrically. Prepare a standard curve as directed in the monograph for folic acid starting with "Place about 0.1 Gm. of para-aminobenzoic acid . . ." Then, by means of a pipette, accurately measure into a 100 cc. volumetric flask sufficient sodium folate solution to contain about 0.1 Gm. of folic acid, dilute to the mark with tenth-normal sodium hydroxide, and proceed with the assay as directed in the folic acid monograph, starting with "Transfer 1 cc. of the solution to a 100 cc. volumetric flask and add 80 cc. of water, 10 cc. of five normal hydrochloric acid . . ." The sodium folate content corresponds to a folic acid concentration of not less than 90 nor more than 115 per cent of the labeled amount.

KREMERS-URBAN COMPANY, MILWAUKEE 1

Solution Sodium Folate: 15 mg. per cc., 1 cc. ampuls.

AMINOPHYLLINE-U. S. P. (See New and Nonofficial Remedies 1948, p. 325).

The following dosage forms have been accepted:

BREWER & COMPANY, INC., WORCESTER 8, MASS.

Tablets Aminophylline: 0.1 Gm. and 0.2 Gm.

BUFFINGTON'S, INC., WORCESTER, MASS.

Tablets Aminophylline: 0.1 Gm. and 0.2 Gm.

Solution Aminophylline: 0.5 Gm., 2 cc. and 20 cc. ampoules and 0.25 Gm., 10 cc. ampoules.

ESTROGENIC SUBSTANCES (WATER INSOLUBLE) (See New and Nonofficial Remedies 1948, p. 370).

The following dosage form has been accepted:

THE SMITH-DORSEY COMPANY, LINCOLN, NEB.

Aqueous Suspension Estrogenic Substances: 10,000 I. U. per cc., 1 cc. ampuls and 10 cc. vials; 50,000 I. U. per cc., 10 cc. vials. Preserved with carbolic acid 0.5 per cent.

TETANUS TOXOID, ALUM PRECIPITATED-U.S.P. (See New and Nonofficial Remedies 1948, p. 501).

CUTTER LABORATORIES, BERKELEY, CALIF.

Tetanus Toxoid Aluminum Hydroxide Adsorbed (Alhydrox): Two 1 cc. vials and 10 cc. vial. Each cc. contains the required amount of tetanus toxoid. Preserved with sodium ethylmercurithiosalicylate 1:10,000.

MUCIN-ALUMINUM HYDROXIDE-MAGNESIUM TRISILICATE.—"Mucotin"—Harrower.—An antacid mixture of gastric mucin, dried aluminum hydroxide gel, U.S.P. ($Al_2O_3 \cdot xH_2O$), and magnesium trisilicate, U.S.P. ($2MgO \cdot 3SiO_2 \cdot xH_2O$), containing the labeled amounts of these ingredients.

Actions and Uses.—A mixture of histamine-free gastric mucin, aluminum hydroxide and magnesium trisilicate has been found to be an effective combination for oral administration in the control of symptomatic gastric hyperacidity and as an adjunct in the treatment of peptic ulcer. Gastric mucin has been shown to impart to the mixture a more distinct protective coating effect on the gastric mucosa than can be demonstrated with the use of antacids alone. Gastroscopic studies indicate that the mucin-antacid combination definitely coats the ulcer crater and may remain in the stomach for over an hour after instillation of the mixture. The antacid effect of the rapidly reacting aluminum hydroxide and the more slowly but prolonged reacting magnesium trisilicate, imparts to the mixture the advantages of both these antacids. The presence of magnesium trisilicate is also believed to counteract the constipating effect of the aluminum hydroxide but the available evidence on this point is not conclusive.

Dosage.—There is as yet no definite evidence by which to determine the optimum exact proportions of the antacids to be used in the mixture, but observations thus far indicate that best results are obtained with preparations containing approximately 10 per cent of gastric mucin. A ratio of 1:1.5:2.75 for gastric mucin-aluminum hydroxide-magnesium trisilicate has been found to give good results. A tablet preparation of these proportions containing gastric mucin 0.16 Gm., dried aluminum hydroxide gel 0.25 Gm. and magnesium trisilicate 0.45 Gm. is recommended in doses of two tablets every 2 hours. The tablets should be well chewed and no fluids taken during the following half hour.

Tests and Standards.—

MUCIN-ALUMINUM HYDROXIDE-MAGNESIUM TRISILICATE TABLETS: These tablets are light cream-colored.

Accurately weigh 25 tablets and grind them to a fine powder. Weigh a portion of powder equivalent to 1 tablet and transfer it to a 250 cc. flask. Add exactly 100 cc. of 0.1 N hydrochloric acid and keep the flask at 37.5 C. for 1 hour, shaking or stirring the mixture continuously during this time. Titrate the excess acid with 0.1 N sodium hydroxide using bromophenol blue T.S.; the volume of 0.1 N hydrochloric acid consumed is not less than 75 cc. for 1 tablet weighing about 1.25 Gm.

Accurately weigh a portion of mucin-aluminum hydroxide-magnesium trisilicate powder equivalent to 3 tablets and determine its nitrogen content according to *Official and Tentative Methods of Analysis of the Association of Agricultural Chemists*, 6th ed., p. 25; each tablet contains not less than 7.0 nor more than 9.0 per cent of the labeled amount of gastric mucin.

Accurately weigh into a platinum crucible a portion of mucin-aluminum hydroxide-magnesium trisilicate powder, equivalent to 1 tablet, add 2 Gm. of anhydrous sodium carbonate and 4 Gm. of anhydrous potassium carbonate, and carefully mix. Ignite at 500 C. for 1 hour and then ignite carefully over a Meker burner until fusion is complete and practically no carbon remains. Cool the crucible, leach the fused mass with about 50 cc. of water, heating if necessary, and transfer solution and residue to a 250 cc. beaker. Slowly add 25 cc. of concentrated hydrochloric acid. Evaporate the solution to dryness on a steam bath, then heat at 100 C. for 2 hours. Treat the residue with 2 cc. of hydrochloric acid and 50 cc. of water, heat to boiling, cool, transfer the solution and insoluble matter to a 250 cc. volumetric flask, make up the solution to the mark, and mix thoroughly. Filter the solution through a No. 42 Whatman paper, rejecting the first 15 cc. of filtrate and saving the precipitate for the silica determination described later. Transfer exactly 100 cc. of the filtrate to a 250 cc. beaker and proceed with the assay for aluminum oxide as directed in U.S.P. XIII, p. 27, in the monograph on Dried Aluminum Hydroxide Gel, beginning with the words, ". . . add 3 drops of methyl red T.S. . . .". Save the filtrate and washings for the magnesium determination described later. The amount of aluminum oxide is not less than 45.0 nor more than 55.0 per cent of the labeled amount of dried aluminum hydroxide gel.

To the combined filtrate and washings saved for the magnesium determination, add 1 Gm. of dibasic ammonium phosphate ($(NH_4)_2 HPO_4$) and then add 2 cc. of ammonia T.S., dropwise and with constant stirring; a crystalline precipitate forms. Allow the mixture to stand for 15 minutes, add 15 cc. of strong ammonia solution, let the mixture stand 4 hours or overnight, and transfer the precipitate to a tared Gooch crucible and wash it with two 5 cc. portions of 1.4 per cent ammonium hydroxide solution. Dry the crucible at 100 C. and ignite to constant weight over a Meker burner, cool and weigh the magnesium oxide formed; the amount of magnesium oxide is not less than 18.0 nor more than 22.0 per cent of the labeled amount of magnesium trisilicate.

Transfer the filter paper containing the precipitate saved from the aluminum oxide determination to a tared platinum crucible and proceed with the assay for silica as directed in U.S.P. XIII, p. 300, in the monograph on Magnesium Trisilicate, beginning with the words, "Heat to dryness . . .". The amount of silicon dioxide is not less than 40.5 nor more than 49.5 per cent of the labeled amount of magnesium trisilicate.

THE HARROWER LABORATORY, INC., GLENDALE 5, CALIF.

Tablets Mucotin: Each tablet contains gastric mucin 0.16 Gm. dried aluminum hydroxide gel 0.25 Gm. and magnesium trisilicate 0.45 Gm.

Command. It should be noted that hospitals in the territories and possessions are not included in the statistical report, which is limited solely to hospital facilities within the continental United States. There are in the registered group 1,387 hospitals approved by the American Medical Association for internship and/or residencies in specialties and 2,611 fully accredited by the American College of Surgeons under its program of general standardization. Changes, corrections and additions have been made in the registered list up to the date of publication and, therefore, totals derived from the list, itself, may vary slightly from those presented in the tables of the statistical report.

Number, Size and Classification of Hospitals

Perhaps the earliest available record of hospitals in the United States is the list prepared under the auspices of the United States Bureau of Education and published in the Transactions of the American Medical Association in 1873. This list contained the names of 178 hospitals with a total of 35,604 beds to which 146,472 patients were admitted during the year 1872. Apparently there were no major attempts to provide further lists of hospitals during the ensuing thirty years or until the publication in 1903 of the Standard Medical Directory. In 1904 the American Medical Association took over the records of the Standard Directory and compiled a list of 2,608 hospitals which were published in the first edition of the American Medical Directory

in 1906. The subsequent listing of 4,359 hospitals in 1909 is generally regarded as the first complete list of hospital services in the United States. Thereafter the number of hospitals published by the American Medical Association increased gradually until a total of 6,852 was reached in 1928. By 1937, however, the registered hospitals had decreased to 6,128, but during the war the number increased again to 6,655. Since 1928 the registration of hospitals has been carried out in accordance with specific standards adopted by the Council on Medical Education and Hospitals.

The number of hospitals currently registered by the American Medical Association is 6,335. Of this total, 4,435 or 70 per cent are nongovernmental hospitals, whereas 1,900 or 30 per cent operate under governmental control. Compared with 1947 the nongovernmental group reported increases in all categories except in the hospitals operating under individual or partnership control. These showed a loss of 11, whereas the church related hospitals gained 17, the other nonprofit associations 51 and the corporations unrestricted as to profit 19. The governmental hospitals, however, decreased by 17. This loss was chiefly in the federal group, which reported 29 fewer hospitals in 1948. The municipal hospitals had 1 less, but the state, county

and city-county groups showed gains of 4, 4 and 5 respectively. The present registration of 6,335 hospitals represents a net gain of 59 compared with the total of 6,276 in 1947. Reference should be made to table C, which gives a summary of hospitals by control, and also table F, which contains a further breakdown of the federal hospital group.

Table D presents a classification of hospitals in accordance with the type of service rendered. Here the

general hospitals constitute the largest group, with 4,589 or 72 per cent of all institutions included in this report. While there was a loss of 27 hospitals in the federal classification and 15 in the individual and partnership group, the addition of 92 in other categories gave a net gain of 50 general hospitals as compared with the previous year. The psychiatric hospitals now total 586 compared with 585 in 1947 and 575 in 1946. In the tuberculosis field, however, there has been a gradual decline from 450 in 1946 and 441 in 1947 to the present total of 438. Relatively few changes have occurred in the other classifications, which include maternal, industrial, eye, ear, nose and throat, children's, orthopedic, isolation, convalescent and institutional services as shown in table D. Tables E and G give further summaries of the registered hospitals in accordance with type of service and control, while table A shows the changes that have occurred in the number of hospitals and bed capacity since 1909.

In table B the general, psychiatric, tuberculosis and other hospitals have been grouped according to size. Here it may be noted that 4,037 or approximately 64 per cent of the registered hospitals have 100 beds or less, 1,484 or 23 per cent range from 101 to 300 beds, while 814 or 13 per cent have more than 300 beds. While the general hospitals follow this same pattern with 68, 24 and 8 per cent respectively, the psychiatric group shows a preponderance of large institutions considering that 56 per cent are over 300 beds.

Bed Capacity

Comparative Totals
1947: 1,425,222
1948: 1,423,520

As mentioned previously, the list of hospitals published in 1873 reported a total of 35,604 beds. By 1909 the capacity had increased to 421,065 and by 1932 it exceeded the million mark. The highest point was reached in 1945, when a total of 1,738,944 beds were reported. Then following the war came a reduction in hospital beds to 1,468,714 in 1946, 1,425,222

in 1947 and 1,423,520 in 1948. In each of these years there was an increase in the nongovernmental hospital beds, but the governmental classification showed losses that were attributed chiefly to the federal group. Thus in the present report the nongovernmental hospitals added 8,736 beds, while the governmental group lost 10,438, a net loss of 1,702 in comparison with the previous year.

The hospitals operating under governmental control have 1,019,767, or 71.6 per cent of all hospital beds, while the nongovernmental group has 403,753 or 28.4 per cent. These ratios may be compared with 72.3 and 27.7 per cent in 1947 and 73.7 and 26.3 in 1946. A summary of the control classification will be found in table C, while table F gives a further breakdown of the federal group, which has 372 hospitals and 185,098 beds. Included in these totals are 125 Veterans hospitals with 105,904 beds.

The survey of 1948 shows a further decline in the number of general hospital beds, which now total 576,459 compared with 592,453 in 1947. Again the reduction is chiefly in the federal group, although small losses are also recorded in the municipal classification and in the hospitals operating under individual and partnership control. As a group, the general hospitals have 40.4 per cent of all registered hospital beds, while the psychiatric institutions have 48.7 per cent, the tuberculosis sanatoriums 5.8 per cent and the other hospitals 5.1 per cent. In relation to bed capacity, therefore, the psychiatric hospitals may be regarded as the largest group, with 691,499 beds compared with 680,913 in 1947. Increases occurred in all categories except in the church related hospitals

and the municipal group, the latter showing a reduction of approximately 4,000 beds due mainly to changes in classification. In the tuberculosis field the bed capacity increased from 81,328 to 81,993, a net gain of 665. There was a loss of 793 beds in the nongovernmental group, but the governmental hospitals reported an increase of 1,458.

It is of interest to note that 97 per cent of the beds in psychiatric hospitals and 87 per cent of the beds in tuberculosis sanatoriums are found in institutions operating under governmental control. Reference should be made to table E, which gives a condensed report on governmental and nongovernmental hospital services. Table G presents a comprehensive analysis of the number of registered hospitals, bed capacity,

The survey of 1948 shows a further decline in the number of general hospital beds, which now total 576,459 compared with 592,453 in 1947. Again the reduction is chiefly in the federal group, although small losses are also recorded in the municipal classification and in the hospitals operating under individual and partnership control. As a group, the general hospitals have 40.4 per cent of all registered hospital beds, while the psychiatric institutions have 48.7 per cent, the tuberculosis sanatoriums 5.8 per cent and the other hospitals 5.1 per cent. In relation to bed capacity, therefore, the psychiatric hospitals may be regarded as the largest group, with 691,499 beds compared with 680,913 in 1947. Increases occurred in all categories except in the church related hospitals

and the municipal group, the latter showing a reduction of approximately 4,000 beds due mainly to changes in classification. In the tuberculosis field the bed capacity increased from 81,328 to 81,993, a net gain of 665. There was a loss of 793 beds in the nongovernmental group, but the governmental hospitals reported an increase of 1,458.

It is of interest to note that 97 per cent of the beds in psychiatric hospitals and 87 per cent of the beds in tuberculosis sanatoriums are found in institutions operating under governmental control. Reference should be made to table E, which gives a condensed report on governmental and nongovernmental hospital services. Table G presents a comprehensive analysis of the number of registered hospitals, bed capacity,

number of bassinets and births and total hospital admissions, all classified by control and type of service.

Number of Patients Admitted

Comparative Totals
1947: 15,829,514
1948: 16,422,774

The number of patients admitted in the registered hospitals in 1948 was 16,422,774, or 1 admission every 1.9 seconds. This is a new high in the utilization of hospital service, as the previous record was 16,257,402 in 1945. Compared with 1947 there was a net increase of 593,260 admissions last year, 86,147 in the governmental hospitals and 507,113 in the non-

governmental group. It should be noted, however, that a reduction of approximately 100,000 admissions occurred in the federal hospitals, but this loss was offset by increases in all other governmental groups. In the nongovernmental classification, the church related hospitals showed an increase of 195,108 admissions, the other nonprofit associations 280,669 and the corporations unrestricted as to profit 64,642. There was a reduction, however, of 33,306 admissions in the hospitals operating under individual and partnership control. The nongovernmental hospitals with only 28.4 per cent of the hospital beds had 12,132,283 admissions, or 73.9 per cent of all patients admitted in 1948. The governmental hospitals with 71.6 per cent of the bed

capacity received 4,290,491 admissions, or 26.1 per cent. The corresponding admission ratios for these two groups were 73.5 and 26.5 in 1947 and 67 and 33 in 1946. In the federal group, as shown in table F, the largest number of admissions, 428,942, occurred in the hospitals operated by the Veterans Administration.

The greatest volume of service was reported in the general hospital group, which had 15,160,062 admissions, an increase of 494,867 in comparison with the previous year. The principal gain was in the church and other nonprofit general hospitals, which admitted 446,000 more patients in 1948. The state hospitals also showed an increase of approximately 14,000, the county hospitals 69,000, municipal 21,000, city-county 23,000 and corporations 61,000. A reduction of 104,000 admissions occurred in the federal general hospitals, however, and 36,000 in the individual and partnership group. The general hospitals received 92 per cent of all patients admitted in 1948. The governmental general hospitals had 3,604,333 admissions or 22 per cent; the nongovernmental general hospitals 11,555,729 or 70 per cent.

The psychiatric hospitals, which have 48.7 per cent of all beds, received only 1.8 per cent of the patients admitted in 1948. The total admissions were 305,000, an increase of 13,046 over the previous year. Gains were recorded both in the governmental and nongovernmental groups, although fewer psychiatric patients were admitted in the federal and municipal classifications and in the hospitals operating under individual and partnership control. The admissions alone do not represent the full volume of service carried out in the psychiatric hospital field. It is necessary to take into consideration also that the psychiatric hospitals maintain an average daily census of 664,399, a total which exceeds the daily patient load in all other registered hospitals.

An increase in tuberculosis hospitalization is shown in the present survey, which reported 105,588 admissions as compared with 99,080 in 1947. Increases occurred in all classifications except the municipal, church, corporation and individual and partnership groups. The tuberculosis hospitals in the governmental group admitted 90,007 patients, while the nongovernmental hospitals reported 15,581. Comparative data for previous years will be found in tables 1 and 2 and other summary tables showing control and service classifications. The admission totals in the present report do not include outpatients and hospital births.

Average Daily Census

Comparative Totals
1947: 1,217,229
1948: 1,217,154

In 1948 the registered hospitals maintained an average daily census of 1,217,154, which is practically identical with the report of the previous year. This average, which does not include newborn infants, represents a total of 445,478,364 patient days. The governmental hospitals with 71.6 per cent of the bed capacity and 26.1 per cent of the total admissions had an average census of 907,569, or 74.6 per cent of the average daily patient load in all registered hospitals. Included in this group are the state psychiatric hospitals, which alone maintain a daily census of 566,220. In the nongovernmental classification, the church and other nonprofit hospitals reported an average of 275,050 or 22.6 per cent, while the proprietary group with a census of 34,535 had 2.8 per cent. In comparison with 1947 there were only minor changes in the nongovern-

mental hospitals and the county, municipal and city-county groups. The federal hospitals, however, showed a reduction of 20,974, while the state hospitals increased their daily census by 25,663.

The general hospitals as a group maintained an average daily census of 437,590, including 176,880 in the governmental division and 260,710 in the nongovernmental hospitals. This is a reduction of 19,171 in relation to the previous report and includes losses of 14,000 in the federal general hospitals, 933 in the county, municipal and city-county groups and 4,375

Church.....	9.6 days	9.0 days	8.4 days
Other nonprofit associations.....	9.7 days	9.1 days	8.6 days
All nonprofit general.....	9.6 days	9.0 days	8.5 days
Individual and partnership.....	5.7 days	6.0 days	5.8 days
Corporations (profit unrestricted).....	7.4 days	7.3 days	6.4 days
All proprietary general.....	6.3 days	6.5 days	6.1 days
All nongovernmental general.....	9.2 days	8.7 days	8.2 days
All general hospitals.....	12.9 days	11.4 days	10.5 days

in the nongovernmental classification. The only gain was in the general hospitals operating under state control, in which a slight increase of 137 was recorded. The general hospitals, with 40.4 per cent of the beds and 92 per cent of all admissions, have 36 per cent of the average daily hospital census.

The average daily census in the psychiatric hospitals was 664,399 as compared with 651,578 in 1947. This is an increase of 12,821, with net gains of 12,151 in the governmental section and 670 in the nongovernmental hospitals. The state psychiatric hospitals increased their average by 23,596, and there were minor gains in the county, nonprofit and corporation groups. Slight decreases occurred in the church and individual

and partnership classifications, while the federal division lost 7,979 and the city hospitals 3,802. As a group the psychiatric hospitals have 48.7 per cent of the bed capacity, 1.8 per cent of the admissions in all registered hospitals and 54.6 per cent of the daily patient load. The nongovernmental psychiatric hospitals reported an average daily census of 16,546, whereas the governmental group had 647,853.

The tuberculosis hospitals reported an average daily census of 66,484, or 5.4 per cent of the total hospital load. This represents an increase of 3,909 in comparison with 1947, but the nongovernmental group with a census of 8,656 showed a loss of 817, whereas the governmental classification added 4,726 and attained the average of 57,828. No significant changes occurred in the other classifications, whose combined census equals approximately 4 per cent of the daily patient load in all registered hospitals.

Percentage of Beds Occupied

Comparative Totals
1947: 85.4
1948: 85.5

In the accompanying table on percentage bed occupancy it will be found that while the over-all rate showed little change in comparison with 1947 the government hospitals as a group reported an increase of 1.2 per cent. Increases occurred in all governmental classifications except in the county hospitals, which maintained the same occupancy level of 81.4 per cent.

In the nongovernmental group, however, there has been a decline in the percentage occupancy in the past two years from 79.1 to 76.7. Lower rates were recorded both in the proprietary and the nonprofit

hospitals, the former showing a reduction from 69.4 to 68.0 and the latter from 80.6 to 77.9.

When the hospitals are viewed in relation to type of service a greater variation in bed occupancy rates will be noted. The highest rate, 96.1 per cent as compared with 95.7 in 1947, occurred in the psychiatric group, where long periods of hospitalization are required and many institutions operate well beyond their rated capacity. The general hospitals, with an average occupancy of 75.9 per cent, showed a reduction of 1.2 in relation to the previous year. Within this

group, the governmental hospitals reported a rate of 75.0 per cent, the nongovernmental general hospitals 76.5. It may be noted, in this connection, that an average occupancy of 85 per cent is generally regarded as the maximum limit of operating efficiency in general hospitals.

Washington.....	51,236
West Virginia.....	52,603
Wisconsin.....	29,618
Wyoming.....	75,212
Total.....	2,794,281

In the tuberculosis hospitals the bed occupancy increased from 76.9 to 81.1 per cent. Here the governmental group reported 80.8 per cent, the nongovernmental hospitals 82.5. Increased occupancy was also noted in the industrial classification and in the isolation hospitals, the latter responding chiefly to seasonal demands as evidenced by their low average of 47.1 per cent. Reduced rates were noted in the maternity, children's, eye, ear, nose and throat hospitals and institutional departments, whereas no change occurred in the percentage occupancy of the orthopedic and convalescent hospitals.

Average Length of Stay

Comparative Totals
1947: 11.4 days
1948: 10.5 days

The average length of stay in general hospitals is shown in the accompanying table, classified according to ownership or control. From this study it is apparent that in comparison with 1947 the length of hospitalization has decreased in all governmental and nongovernmental groups. In the governmental general hospitals, which declined from 19.5 to 17.9 days, the length of stay varies from 10.0 in the city-county hospitals to 27.9 days in the federal classification. In the nongovernmental hospitals the length of stay is much lower, as evidenced by the reported average of 8.2 days compared with 8.7 in the previous year. Here the church and other nonprofit general hospitals showed a reduction from 9.0 to 8.5 days, while the proprietary group reported a change from 6.5 to 6.1. As a group the general hospitals showed an average length of stay per patient of 10.5 days, while the corresponding report was 11.4 in 1947 and 12.9 in 1946. If the present average is compared with the report of 15.9 days in 1945 we find that the period of hospitalization has been reduced by 5.4 days in the last three years. This reduction applied to the present total of 15,160,062 admissions in the general hospital group would represent a saving of 81,864,335 days of hospital care.

Births in Hospitals

Comparative Totals
1947: 2,837,139
1948: 2,794,281

The tremendous increase in the utilization of hospital facilities for maternity care is clearly illustrated in table K, which shows a total of 2,794,281 hospital births in 1948 as compared with 621,896 in 1929. The number of births in the registered hospitals reached the two million mark for the first time in 1946 but the following year set an all time record of 2,837,139. In comparison with 1947, therefore, the number of births reported in the present survey shows a decrease of 42,858. The

survey it will be seen that the general hospitals had 97 per cent of all births reported in the hospitals registered by the American Medical Association.

Nursing Education and Service

Comparative Totals
Graduate Nurses
1947: 167,354
1948: 196,120

Student Nurses
1947: 94,133
1948: 100,174

In 1948 three major studies were completed in relation to the nursing field, one by the Committee on Nursing of the American Medical Association, whose report appeared in *THE JOURNAL*, July 3, 1948, pages

governmental hospitals as a group reported an increase of 15,959, although the municipal hospitals had 62,431 fewer births in 1948. In the church and other nonprofit hospitals there was a reduction of 45,594, while the proprietary classification showed also a loss of 13,223. It may be noted that the governmental institutions report 16.4 per cent of the births, the nongovernmental hospitals 83.6 per cent.

The general hospitals reported a total of 2,715,645 births, including 447,630 in the governmental classification and 2,268,015 in the nongovernmental general hospitals. In comparison with the previous year there was an increase of 17,972 in the governmental division, while the nongovernmental classification showed a reduction of 59,286, indicating a net loss of 41,314 for the general hospitals as a group. From the present

878-879, one under the sponsorship of the National Nursing Council entitled "Nursing for the Future" and one by the Committee on the Function of Nursing which described its study as "A Program for the Nursing Profession." All of these studies make valuable contributions to future planning and will be potent factors in the creation of new patterns of nursing organization, nursing education and nursing service in accordance with total needs.

The present annual survey conducted by the Council on Medical Education and Hospitals shows an appreciable increase in nursing personnel in hospitals as compared with 1947. While gains occurred in all professional and auxiliary nursing groups, the expansion was most pronounced in relation to the total graduate nursing personnel, the full time general duty

nurses and the practical nurses and attendants. The number of graduate nurses exclusive of private duty nurses employed in hospitals increased from 167,354 to 196,120, the full time general duty nurses from 86,218 to 104,041 and the practical nurses and attendants from 119,746 to 141,834. Reference should be made to the tables on professional and auxiliary nursing personnel as well as the accompanying data on schools of nursing education.

While the number of accredited schools of nursing decreased from 1,212 to 1,163, the enrolment increased from 94,133 in 1947 to 100,174 in 1948. The recruitment of student nurses has been a major effort in recent years through the American Hospital Association's Student Nurse Recruitment Committee. Cooperating in this activity were representatives of nursing organizations, the Advertising Council, the American Red Cross, the American College of Surgeons, the American Medical Association, the American Protestant Hospital Association, the Catholic Hospital Association and the United States Public Health Service. The nurse recruitment program will in the future be carried on through the National Committee on Careers in Nursing sponsored by the national nursing organizations.

that projection apparatus is readily available. Of the general hospitals 1,381 have their own sound equipment, 556 have silent projectors and 948 report that facilities are readily available. The data obtained in this survey will be referred to the American Medical Association Committee on Medical Motion Pictures for further analysis and study.

Certification in Relation to Staff Appointments

The standards of the Council on Medical Education and Hospitals governing the registration of hospitals by the American Medical Association specify that the medical staff shall be composed of physicians who have satisfactory qualifications as to training, licensure and ethical standing. While this indicates that staff physicians should be proficient in the fields of practice to which they devote themselves, it was never intended that hospital staffs should be limited to physicians certified by the specialty boards. The Council has stated that "Hospital staff appointments should depend on the qualifications of physicians to render proper care to hospitalized patients, as judged by the professional staff of the hospital, and not on certification or special society memberships."

Medical Motion Pictures

At the request of the American Medical Association's Committee on Medical Motion Pictures, a study was made in connection with the present Annual Census to ascertain the extent to which motion picture films are being utilized in hospital educational programs. Included in this study were the following questions: 1. Are motion pictures used in the hospital's educational program? 2. Does the hospital own a sound projector? 3. A silent projector? 4. What is the chief source of the films used?

In relation to the first question a total of 2,696 hospitals, or 42.5 per cent of all registered hospitals, reported the use of motion picture films, whereas 2,841 gave a negative answer and 789 did not reply. As might be expected, the use of films is relatively greater in the larger institutions, the report showing that motion pictures are employed in 76 per cent of the hospitals over 200 beds, in 70 per cent of hospitals of 101 to 200 beds and in 25 per cent of those with 100 beds or less. In the general hospital group 1,985 out of 4,589 include films in their staff programs. A total of 2,157 hospitals own sound equipment, while 723 own silent projectors. In 1,138 hospitals which do not provide their own facilities it was indicated, however,

In recent years it has been reported, however, that certification has to an increasing degree become the principal factor in the selection of staff physicians, with the result that other well qualified applicants have in many instances found difficulty in obtaining hospital appointments. An effort has been made, therefore, in the present survey to ascertain whether this trend has become a major factor in relation to staff appointments and promotions. In regard to the question, "Is specialty board certification a requirement for appointment to the regular staff?" 270 general hospitals answered yes, 2,135 said no and 2,184 did not reply. This would indicate that in the 4,589 general hospitals registered by the American Medical Association approximately 6 per cent have adopted specialty certification as a requirement for staff appointment. In the other hospitals, totaling 1,746, the ratio was 5 per cent, as 88 hospitals answered yes, 698 gave a negative reply and 960 did not respond. There was some variation, however, according to size, with the higher percentage occurring in hospitals over 100 beds. The replies were rather similar in regard to the question, "Is specialty board certification a requirement for staff promotion?" In this connection 258 general hospitals and 94 other institutions gave an affirmative answer,

and again the higher percentage level appeared in the larger institutions.

In the 1947 survey the Council requested information on the percentage of regular and courtesy staff physicians certified by the specialty boards, and received replies from 1,837 of the 4,539 general hospitals registered at that time. While the information is not complete, it may be of interest to note that in this group of 1,837 hospitals, 307 did not list board certified physicians on their regular staff, 824 reported 1 to 29 per cent of their physicians certified, 371 had 30 to 49 per cent and 335 had 50 per cent or more. From the reports of 1,228 general hospitals the corresponding figures in relation to the courtesy staff are 389, 527, 113 and 199 respectively. On a percentage basis it will be found that in relation to the regular staff 18 per cent of the reporting hospitals had certification ratios of 50 per cent or more whereas 20 per cent of the hospitals had 30 to 49 per cent of their physicians certified, 45 per cent reported ratios of 1 to 29 per cent and 17 per cent had no certified physicians. For the courtesy staff the corresponding hospital percentages were 16, 9, 43 and 32. In general, the same patterns were observed in both the governmental and nongovernmental hospital groups.

General Practice Sections in Hospitals

The development of the certifying boards with the subsequent emphasis on specialization has also focused attention on the general practitioner and his relationship to hospital practice. There is growing concern that the general practitioner is frequently excluded from staff privileges and is thus unable to give to his patients the full advantages of modern hospital care. One of the factors that have limited his opportunities is the tendency in many hospitals to organize their service on a departmental basis that recognizes primarily the specialty fields. Then, too, there has been reluctance on the part of hospitals to create corresponding sections in general practice because of the problems involved in the definition of service and the overlapping of assignments that might often be necessary to utilize fully the skill and ability of individual practitioners.

The establishment of a Section on the General Practice of Medicine by the House of Delegates of the American Medical Association in 1945 has done much to clarify the status of the general practitioner. Further action occurred in 1946, when the House of Delegates adopted the following resolution with reference to the establishment of general practice sections in hospitals:

WHEREAS, Many hospitals have not established general practice sections in their visiting active staffs and their governing heads are doubtful whether such action has the approval of the bodies which set up the rules and regulations for the approval of their hospitals for interns and residents; therefore be it

Resolved, That hospitals should be encouraged to establish general practitioner services. Appointments to a general practice section shall be made by the hospital authorities on the merits and training of the physician. Such a general practice section shall not per se prevent approval of a hospital for the training of interns and for residencies. The criterion of whether a physician may be a member of a hospital staff should not be dependent on certification by the various specialty boards or membership in special societies.

It should also be noted that the American Medical Association's standards for hospital registration were revised in 1947 so as to give specific reference to the inclusion of general practice sections in the organization of hospital services.

In recent years there have been reports of an increasing number of general practice sections in hospitals.

To ascertain the extent of this development, the Council in its Annual Census of 1947 requested the registered hospitals to supply information on the following question: "In the organization of the medical staff, has the hospital established a general practice section?" Of the 4,539 general hospitals registered at that time, 837 answered yes, 2,521 said no and 1,181 did not reply. In the general hospitals which gave an affirmative answer the following groups are represented: federal 56, state 8, county 35, city 50, city-county 8, church 231, nonprofit association 278, individual and partnership 125 and corporation 46. On the basis of bed capacity the hospitals which reported general practice sections may be divided as follows: hospitals with 15 beds or less, 40; 16 to 25 beds, 101; 26 to 50 beds, 171; 51 to 100 beds, 198; 101 to 200 beds, 190; 201 to 300 beds, 85; over 300 beds, 52; total, 837. Further studies are being made regarding the organization of general practice sections in these hospitals.

ESSENTIALS OF A REGISTERED HOSPITAL

Prepared by the
Council on Medical Education and Hospitals
of the
American Medical Association

(Revised to December 1948; originally published
J. A. M. A. 92: 1058 [March 30] 1929)

Introduction

Hospitals should be organized and conducted primarily for the purpose of providing facilities where the sick and the injured of the community may be given scientific and ethical medical care.

Registration distinguishes between recognized hospitals and those failing to meet the standards for recognition. It is a prerequisite to the consideration of a hospital for approval for intern training or for residencies in specialties.

The registration of hospitals, the approval of hospitals for intern training, approval for residencies and fellowships in specialties, and all other services of the American Medical Association pertaining to hospitals are carried on by the Council on Medical Education and Hospitals. Separate essentials have been adopted for each of these types of approval.

It is the desire of the Council to cooperate in every way for the improvement of hospital service, whereby the sick and injured may be provided with scientific and ethical medical care.

The Council does not have nor does it assume legal authority over any hospital. It recognizes clearly that the officers in charge of such institutions have the unquestioned right to conduct the hospitals in any way they may deem wise. If a hospital desires to have its name appear on the American Medical Association Hospital Register and thus have the recognition of that Association, it should be willing to comply with the principles which the Council on Medical Education and Hospitals considers necessary.

I. Organization

1. The organization should consist of a governing body qualified to administer a hospital. This may be a board of trustees or directors, a partnership or an individual. Such a board, partnership or individual must assume final authority and responsibility for administration.

2. There must be a well qualified executive officer designated as administrator, superintendent, director or by some other title. This person should be responsible to the governing body for carrying out its policies. The executive officer should be assisted by competent personnel adequate to the needs of the institution.

II. Physical Plant

1. The hospital plant should consist of modern, safe buildings maintained in a sanitary condition, provided with fire protection, preferably fireproofed, and adequately equipped and furnished for the comfort of patients. Equipment for diagnosis and treatment should be reasonably complete for all types of work the staff purports to carry on in the hospital.

2. Institutions accepting surgical and obstetric patients should provide a modernly equipped operating room, a delivery room and a nursery, with suitable safeguards against infection. Hospitals that are strictly limited in the type of service they offer are not expected to have the complete organization and equipment of a general hospital.

III. Medical Staff

1. Since the medical staff is the most important factor in the delivery of medical service to patients, too great care cannot be exercised in the selection of staff members. The staff should be limited to physicians holding the degree of doctor of medicine from medical colleges acceptable to the Council on Medical Education and Hospitals, having satisfactory qualifications as to training, licensure and ethical standing, and to dentists who are graduates of recognized dental colleges and whose professional ability and standing are known to the medical staff.

2. Osteopaths, chiropractors and other nonmedical practitioners may not be permitted to use the facilities of hospitals desiring to conform to these standards. They may not enter data on the records, carry out diagnostic procedures or treatments, or in any way assist in this work.

3. The form of organization of the staff is determined by the size and the activity of the hospital in accordance with its needs.

4. Even in small hospitals where there are few physicians and where an elaborate organization is not practicable, there should be some authority competent to pass on the qualifications of those who seek to use the hospital's facilities. Special care should be exercised in the assignment of surgical privileges since it is essential for the safety of patients that both the surgeon and his assistant be properly qualified.

5. Where further organization is needed it should include officers (such as president, secretary and others) and committees (such as executive, medical records and credentials), elected or appointed according to regularly adopted constitution and by-laws.

6. Departmental sections, such as in medicine, obstetrics, surgery, general practice, etc., should be organized as may be indicated.

7. Staff meetings should be held primarily for the purpose of reviewing the professional work of the hospital, including reports of autopsy and pathologic studies. Staff meetings might also include the presentation of medical and scientific papers.

8. Minutes of all staff meetings and attendance records should be kept by the secretary of the staff.

IV. Pathology and Laboratory Diagnosis

1. Laboratory services adequate to meet the needs of the hospital should be provided.

2. The pathologist should hold the degree of doctor of medicine from an acceptable medical school and should have qualifications in pathology acceptable to the Council. Where it is not possible to employ the services of a pathologist directly, arrangements should be made for a consulting service for tissue and postmortem examinations and for the interpretation of tests and examinations in clinical pathology. All surgically removed tissues should be examined, described and diagnosed by a pathologist.

3. The laboratory should be equipped for all routine procedures and for whatever additional tests and examinations are frequently called for by the staff.

4. At least one adequately trained clinical laboratory technician should be employed.

5. A system of records should be maintained for all work performed in the laboratory.

6. Autopsies.—Every effort should be made to secure consent for the performance of autopsies. They should be conducted by a qualified pathologist or under his supervision, and protocols, including clinical summaries, should be prepared.

7. The department of pathology should be operated primarily for the benefit of the patient and not to make profits for the hospital.

V. Radiology

The responsibility for all radiologic examinations must rest on the radiologist who is head of the department. His findings and conclusions for all examinations should be placed in the

patient's chart. Nothing in this provision should preclude additional study and interpretations by qualified attending physicians on the staff.

2. The radiologist should hold the degree of doctor of medicine from an acceptable medical school and should have qualifications in radiology acceptable to the Council.

3. The department of radiology should be operated primarily for the benefit of the patient and not to make profits for the hospital.

VI. Anesthesia

The anesthesia service should be under the direction of competent medical personnel. The anesthesiologist should hold the degree of doctor of medicine from an acceptable medical school and should have qualifications in anesthesiology acceptable to the Council. If an anesthesiologist is not available, supervision of the service may be assigned to a staff physician who has had special training in this field. Nurse anesthetists, when properly qualified, may participate in the administration of anesthesia.

VII. Nursing Service

1. A competent nursing service should be provided, adequate for complete patient care during the day and at night, and for operation of the surgical and obstetric departments. All nursing should be supervised by registered graduates. Hospitals that do general surgery should have a trained operating room nurse.

2. Dietetics.—The services of one or more graduate dietitians, as may be required, should be available for supervision of regular and special food services. Where graduate dietitians cannot be employed, these functions should be assumed by some other competent person.

VIII. Pharmacy

The handling of drugs should be properly supervised and should comply with all legal regulations. Accurate records should be maintained. A qualified person, preferably a graduate pharmacist, should be in charge; in any case, all prescriptions should be filled by a graduate pharmacist.

IX. Medical Records

1. An adequate record system should be maintained. No specified forms are recommended since requirements vary greatly according to the size and type of the hospital.

2. The case history and physical examination should be recorded as soon as practicable after the patient's admission; in no case should this be delayed for more than twenty-four hours after admission. Except in emergencies the history, physical examination, laboratory work and provisional diagnosis should be recorded prior to operation. The attending physician is directly responsible for the accuracy and completeness of case records, even though he may not himself have prepared them.

3. An acceptable case record should include a) identification data, chief complaint, past medical history, family history, history of present illness, physical examination and provisional diagnosis; b) consultations and other special reports; c) clinical laboratory, pathology and x-ray findings; d) medical or surgical treatment, progress notes, final diagnosis, condition on discharge and follow-up records, and e) report of autopsy if performed.

4. No case record should be considered complete until it has been reviewed and signed by the attending physician.

5. Monthly and annual analyses of services to patients should be made to assist the staff in the evaluation and improvement of the professional work in the hospital.

X. Ethics

In order that a hospital may be eligible for registration it is expected that the staff and administration conform to the Principles of Medical Ethics of the American Medical Association regarding advertising, commissions, division of fees, secret remedies, extravagant claims, overcommercialization and other requirements.

XI. Admission to the Register

Hospitals desiring registration should apply to the Council on Medical Education and Hospitals, 535 North Dearborn Street, Chicago 10, Illinois. Application forms in duplicate will be furnished on request. These should be carefully completed by the superintendent or the medical director and one copy returned to the Council.

HOSPITALS REGISTERED BY THE AMERICAN MEDICAL ASSOCIATION

The following list contains the names of 6,335 hospitals, sanatoriums and related institutions that are located in the United States and 125 in Alaska, Canal Zone, Guam, Hawaii, Puerto Rico and Virgin Islands. The list for each state is presented in two groups: (1) hospitals and sanatoriums, and (2) related institutions. The related institutions include infirmaries, nursing homes and other institutions designed to give certain medical and nursing care in an ethical and acceptable manner, without giving a full hospital service.

Registration is a basic recognition extended to all hospitals and related institutions in accordance with the requirements outlined in the Essentials of a Registered Hospital officially adopted by the House of Delegates of the American Medical Association in 1928 and revised in 1948. Approval, on the other hand, is a designation extended by the Council on Medical Education and Hospitals to certain registered hospitals which meet the requirements for internship, residency or fellowship training; approval is also extended by the American College of Surgeons to those hospitals which unconditionally meet its minimum requirements for general standardization.

KEY TO SYMBOLS AND ABBREVIATIONS

- * Approved by the Council on Medical Education and Hospitals for the training of interns. Reference should be made to the list of Approved Internships which will be published in the next issue of The Journal, May 14.
- + Approved by the Council on Medical Education and Hospitals for the training of resident physicians. Reference should be made to the list of Approved Residencies and Fellowships which will be published in the next issue of The Journal, May 14.

- ▲ Approved by American College of Surgeons as meeting unconditionally its minimum requirements for general standardization.

- School of nursing accredited by state board of nurse examiners.
- ◎ Affiliated for nurse training on state accredited basis.
- † Figures for "average census" and "admissions" are exclusive of newborn infants.

The column headed "Type of Service" indicates the general categories of patients treated:

Card	Cardiac	ENT	Eye, ear, nose and throat	Iso	Isolation	N&M	Nervous and mental
Chil	Children	Gen	General	Mat	Maternity	Orth	Orthopedic
Chr	Chronic	Ineur	Incurable	MatCh	Maternity and children	SkCa	Skin and cancer
Conv	Convalescent and rest	Indus	Industrial	McDe	Mentally deficient	TB	Tuberculosis
Drug	Drug and alcoholic	Inst	Institutional	Ment	Mental	Ven	Venereal
Epil	Epileptic						

The column headed "Control" indicates control, or auspices under which the institution is conducted:

GOVERNMENTAL				NONPROFIT ORGANIZATIONS		PROPRIETARY	
Fed	Federal	State		Church		Indiv	Individual
IA	Indian Affairs	City		NPAssn	Nonprofit Association	Part	Partnership
Army	United States Army	County				Corp	Corporation (unrestricted as to profit)
USAF	United States Air Force	City-County					
Navy	United States Navy	CyCo					
USPHS	United States Public Health Service						
Vet	Veterans Administration						

Corrections were made in the list to the time of going to press. Totals of the list, therefore, may vary from totals in Tables 1 and 2 which were necessarily compiled earlier.

SCHOOLS FOR X-RAY TECHNICIANS

In this issue of THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION the Council on Medical Education and Hospitals again presents a list of approved schools for x-ray technicians. During the past year 14 schools were approved and one course discontinued. The 224 schools currently listed have reported a total of 1,176 students, as compared with 948 enrolments last year. There were 656 graduates, an increase of 157 over the previous year. As newly approved programs are further developed and classes enlarged in other schools, a still greater number of trained x-ray technicians will be available during the ensuing year.

Of the 224 schools approved, 198 have indicated high school graduation as a prerequisite for admission. Various other requirements are in effect in the remaining 26 schools, ranging from one to four years of college and graduation from an accredited school of nursing. A majority of the schools report that no tuition is charged; a majority, also, accept men students for training. As will be noted by referring to the list, each course is under the direction of a radiologist.

A brief history of the development of the list of approved schools for x-ray technicians by the Council may be of interest. The American Registry of X-Ray Technicians, which is sponsored by the American College of Radiology, requested the American Medical Association to assume the responsibility of approving schools for x-ray technicians. The Essentials of an

Acceptable School for X-Ray Technicians were formulated and published originally in THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION Jan. 13, 1945. The Registry and the American College of Radiology worked with the Council in the preparation of these Essentials, officially adopted by the House of Delegates in June 1944, and in the preparation of the first list approved by the Council, also published Jan. 13, 1945. This list contained the names of 112 schools which substantially conformed to the minimum standards; 478 students were enrolled. Candidates for admission should satisfy one of the following requirements:

1. Completion of the four years of high school. Courses in physics, algebra, geometry and chemistry are recommended.
2. Passing of a college entrance examination for admission to an accredited college or university.
3. Graduation from a school of nursing recognized by the state board of nurse examiners.

Correspondence regarding schools for x-ray technicians should be addressed to the Council on Medical Education and Hospitals. Graduates desiring registration should communicate with the American Registry of X-Ray Technicians, 2900 East Minnehaha Parkway, Minneapolis 6.

APPROVED SCHOOLS FOR X-RAY TECHNICIANS

Council on Medical Education and Hospitals of the American Medical Association

NOTE: Complete details regarding admission to an approved school for x-ray technicians can be obtained by communicating directly with the radiologist. Asterisk (*) after name of school indicates that male as well as female students are admitted.

SCHOOLS FOR MEDICAL RECORD LIBRARIANS

The Essentials of a Registered Hospital of the American Medical Association, the basic requirements for recognition by the Council on Medical Education and Hospitals, state, in part, that an adequate record system should be maintained in hospitals. When, therefore, in 1942, the American Association of Medical Record Librarians requested the House of Delegates of the American Medical Association to originate a list of schools for medical record librarians meeting specific standards, the Council was instructed to proceed with the establishment of essentials and preparation of an approved list.

In June 1943 the Essentials of an Acceptable School for Medical Record Librarians, drawn up by the Council with the cooperation of the American Association of Medical Record Librarians, were officially approved by the American Medical Association House of Delegates. The first approved list contained the names of 10 hospitals, colleges and universities; currently 13 schools are approved. While 2 additional schools are under consideration at the present time, further expansion of educational opportunities in this field are indicated in order to meet the growing needs for trained personnel.

The number of students completing the course during 1948 was 58; an enrollment of 118 has been reported by the schools now approved. Candidates for admission to approved schools should be proficient in typing and

shorthand and, in addition, should fulfil one of the following requirements:

1. Completion of two academic years of study in a college of liberal arts approved by a recognized accrediting agency.
2. Graduation from a school of nursing recognized by a state board of nurse examiners.

Nine schools accept students who have completed two years of college or have finished nurses' training; 1 requires three years of college; 1 a degree and 2 accept high school graduates in relation to a four year college course. The tuition range is from \$125 to \$300 a year; a uniform tuition of \$150 is in effect in 6 schools. Three schools confer a degree, 9 issue certificates and 1 a diploma.

Scholarships in this field are offered by the National Foundation for Infantile Paralysis. Funds have also been granted by that foundation to provide inservice training programs, and institutes are sponsored by the American Hospital Association in cooperation with the American Association of Medical Record Librarians.

Schools desiring approval should apply to the Council on Medical Education and Hospitals. Application forms will be furnished on request. Correspondence regarding registration should be addressed to the American Association of Medical Record Librarians, 22 East Division Street, Chicago 10.

† Four academic years and one summer session.

SCHOOLS FOR OCCUPATIONAL THERAPY- TECHNICIANS

In June 1933 a resolution was presented to the House of Delegates of the American Medical Association which requested that, if feasible, plans be made for the establishment of standards, ratings and inspections of training schools for occupational therapy technicians.

The Board of Trustees referred this resolution to the Council on Medical Education and Hospitals for consideration and investigation. The inspection work, which began in November 1933, was carried out in conjunction with the other activities of the Council, the schools being inspected by members of the staff on their regular tours of hospital inspection. Thirteen schools were visited. On completion of the inspections, joint meetings were held with representatives present from the American Occupational Therapy Association and the American Medical Association Council on Physical Medicine and Rehabilitation and Council on Medical Education and Hospitals for the purpose of developing standards in this field. On Feb. 17, 1935, the proposed Essentials of an Acceptable School of Occupational Therapy were adopted by the Council, and at the Atlantic City session of the American Medical Association in June 1935 they were ratified by the House of Delegates. Certain sections of the Essentials were subsequently revised and adopted by the Council at its meeting Feb. 12, 1938. The first list of approved schools was published by the Council on Medical Education and Hospitals March 26, 1938. In this list there were 6 schools which conformed to the newly adopted minimum requirements, 1 Canadian school being included in the group. At present 25 schools are approved. One university had no graduates in 1948,

inasmuch as the course had been lengthened to three years in 1946; the remaining 24 schools graduated 455 students as compared with 320 last year. On the basis of data furnished the Council by all of the 25 schools presently approved, it is expected that there will be approximately 475 graduates in 1949.

The present standards of the Council specify that colleges offering training courses in occupational therapy, which are combined with work leading to a bachelor's degree, should require the candidates for this combined course to comply with the regular entrance requirements of the school concerned. Other candidates should furnish proof of having completed one year of college education or its equivalent.

The training in some schools is on three levels, the duration of the course, entrance requirements and tuition varying with the type of course offered. The regular course in occupational therapy is approximately three years in duration. Mostly, however, the courses are now conducted on a degree basis, with four or five years required for completion of training. Advanced standing is also offered, so that students with proper qualifications may obtain a certificate in occupational therapy after eighteen months' training. All of the approved schools are affiliated with senior colleges or universities.

Application for approval of occupational therapy schools should be submitted to the Council on Medical Education and Hospitals. Inquiries regarding the registration of qualified therapists should be addressed to the American Occupational Therapy Association, 33 West 42d Street, New York 18.

SCHOOLS FOR PHYSICAL THERAPY TECHNICIANS

As early as 1936 the Council on Medical Education and Hospitals completed a survey of schools for physical therapy technicians. The first approved list, published Aug. 29, 1936, contained the names of 13 schools which essentially met the minimum standards ratified by the House of Delegates in May 1936. Two years previously the Council had been directed by the Board of Trustees of the American Medical Association to proceed with the establishment of standards and a listing of qualified schools. Cooperating with the Council in this activity are the Council on Physical Medicine and Rehabilitation of the American Medical Association, the American Congress of Physical Medicine and the American Physical Therapy Association.

The 1948 list, herewith presented, includes the names of 26 approved schools, with 532 students enrolled in the regular courses. It is anticipated that the number of graduates in 1949 will be approximately 425 in the schools currently approved. This total may be further increased through additional courses that are now in the process of development. The accompanying tabulation gives the names of the medical director and the technical director of each school, entrance requirements, dura-

tion of course, time of admission, maximum enrolment and tuition and indicates whether a certificate, diploma or degree is granted on graduation. Applicants should fulfil one of the following requirements:

1. Graduation from an accredited school of nursing.
2. Graduation from an accredited school of physical education.
3. Two years of approved college training, including satisfactory courses in biology and other sciences.

Courses in general physics and chemistry, as well as biology, are highly recommended for all who seek to enter training in this field.

Acceptable schools for physical therapy technicians may be conducted by accredited universities, medical schools, colleges or hospitals. The Council on Medical Education and Hospitals will be glad to send application blanks to any school seeking approval. The American Registry of Physical Therapy Technicians, sponsored by the American Congress on Physical Medicine, accepts for examination graduates of schools listed by the Council. The offices of the Registry are at 30 North Michigan Avenue, Chicago 2.

* Courses are so arranged that any of the entrance requirements will qualify students for training. a = Graduation from accredited school of nursing; b = Graduation from accredited school of physical education; c = Two years of college with science course; d = Three years of college with science course; e = Four years of college with science course. H.S. = High school graduation.

1. Male students are admitted.
2. R.N. plus one year college.
3. Nonresidents charged additional fee.

SCHOOLS FOR MEDICAL TECHNOLOGISTS

The accompanying list of 383 approved schools for medical technologists indicates the interest manifested in this field of technical training. During the past year 46 schools have been accepted as meeting the minimum standards for recognition. Prerequisites for admission to the approved schools, as included in the Essentials of an Acceptable School for Medical Technologists prepared by the Council on Medical Education and Hospitals of the American Medical Association with the cooperation of the American Society of Clinical Pathologists and ratified by the House of Delegates of the American Medical Association in May 1936, are as follows:

- Two years of college work, including general chemistry, quantitative chemistry and biology, from an accredited college or university. Bacteriology may be substituted for biology. Organic chemistry and physics are highly recommended; or
- Graduation from a school of nursing recognized by the state board of nurse examiners and, in addition, one year of college work—30 semester hours (45 quarter hours)—including courses in chemistry and biology.

The original list of 96 approved schools was published in 1936. Since that time there has been a constant annual increase in number of schools approved, enrolments and students graduated. Records of 1936 disclose a total of 711 students enrolled. Comparing

this with the 1948 enrolment of 2,751, it is apparent that the selection of this type of training by students who have completed at least two years of college will eventuate in a large proportion of hospitals obtaining qualified medical technologists in their clinical laboratory departments.

The 383 schools currently approved reported 1,499 graduates in 1948. This figure will be considerably augmented in the present calendar year, as many recently approved schools have now developed their training programs to accommodate additional students. At the same time, following former trends, enrolments in other approved schools will increase with a corresponding increase in the number of qualified graduates.

Minimum entrance requirements of two years of college are maintained by 274 of the 383 approved schools, whereas the remaining 109 schools require three years of college or a degree. Further detailed information regarding tuition, length of training and names of directors is available in the accompanying list.

Correspondence regarding schools for the training of medical technologists should be addressed to the office of the Council on Medical Education and Hospitals. Graduates of approved schools desiring registration should communicate with the Board of Registry of Medical Technologists, Ball Memorial Hospital, Muncie, Ind.

APPROVED SCHOOLS FOR MEDICAL TECHNOLOGISTS
Council on Medical Education and Hospitals of the American Medical Association

NOTE: Under "Tuition" the letter B indicates that a breakage fee is charged; the letter U indicates university fees. Students lacking the scholastic requirements should contact the registrar of the college or university and not the hospital. Those who wish to enroll in a course given by the college or university or who desire to transfer their credits should correspond with the registrar and not the hospital. Asterisk (*) after name of school indicates that male as well as female students are admitted.

SATURDAY, MAY 7, 1949

THE PRESIDENT'S MESSAGE AND THE COM-
PULSORY HEALTH INSURANCE BILL

President Truman sent to the Congress on April 22 his proposals for the health of the nation. On April 25 Senate Bill 1679 was introduced by a group of senators, including Thomas of Utah, Murray of Montana, Wagner of New York, Pepper of Florida, Chavez of New Mexico, Taylor of Idaho, McGrath of Rhode Island and Humphrey of Minnesota, and in the House by Congressmen Dingell of Michigan and Biemiller of Wisconsin. Elsewhere in this issue (page 114) is a digest of the 163 page text of this measure and also a statement released to the press by Dr. Elmer L. Henderson, chairman of the Board of Trustees of the American Medical Association, as comment on the President's message.

Obviously the propaganda agencies that are devoted to the cause of compulsory sickness insurance provided the thought, if not the language, for President Truman's address. Here are many of the same old misrepresentations that have characterized their previous statements on this subject. Lacking only is reference to the "socialization of medicine"; apparently the proponents of nationalized political medical care have learned that the American people are exceedingly distrustful of socialism. No doubt the most important objection to medicine socialized by nationalization of its control is the well established fact that the taking over of medicine is but the first step toward nationalization of every interest and activity of the nation.

Senate Bill 1679 itself begins with seven premises, not one of which is supported by anything resembling acceptable evidence. The language of these seven premises seems deliberately chosen to frighten the American people. They speak of the "shattering cost" of serious or chronic illness and of the inability of

the people to meet such costs; of the inability of most people to benefit from modern preventive medicine; of the "critical" shortage of personnel; of the "critical" shortage of facilities; of "wholly inadequate" provision for farm families; of the "appallingly inadequate" development of research and of "serious maldistribution" of personnel and facilities. Then, with the impudent deception characteristic of these propagandists, comes the weird assertion that failure to correct these conditions will lead to governmental control, state medicine and regimented doctors. With this is the assertion that existing inadequacies cannot be remedied under the present system of payment for medical care or under any voluntary insurance system. This manipulation of thought and diction is characteristic of the political demagogue and bears no resemblance to anything that is tolerated in the field of medical science.

Incorporated in the 163 pages of text of this highly intricate and somewhat confused measure are Senator Pepper's proposals for aid to medical education, other proposals for aid to medical research, new proposals for the training of practical nurses, expansion of the Hill-Burton Act, special assistance to farmers' cooperatives and expansion of other phases of the Social Security Act concerned with health. No doubt either the present or some future Congress will proceed with the necessary expansion of the Hill-Burton Act; necessary aid to medical research, such as could be achieved by the National Science Foundation, and encouragement of aid in the care of the disabled and handicapped.

Primarily important to the medical profession is Title VII of the Act, "Prepaid Personal Health Insurance Benefits." Of the 163 pages of the Act, this section occupies approximately one third. Under these proposals medical care in the United States would be dominated by a National Health Insurance Board of five, who would be advised by a National Advisory Medical Policy Council. In every state there would be other boards and other advisory councils. In every area there would be more boards and more advisory councils and committees, and in every community there would be more such regulating agencies. Repeatedly the statement has been made that this is not political medicine. If the people who conduct the system are politically appointed and hold their offices only by political support, how could such a system fail to be politically controlled? Actually the measure provides that the federal agency may interfere in any state and take over the operation of the system in that state if the governor of any state should fail to set up the system.

The section of the bill dealing with medical care states that there shall be no discrimination on account of race, creed or color, but the section of the measure dealing with education says that any state which provides separate facilities for persons of different race or color is to duplicate for minority groups the facilities provided for majority groups.

In any community physicians would be asked to determine whether they will choose to be paid by the government on a fee for service basis, a panel system or a salary or varying combinations of these techniques. The decision is to be made in each area by a majority of medical practitioners or dental practitioners who agree to furnish the services, except that other methods will be provided for those who do not choose to vote with the majority if the authorities are convinced that the alternative method will promote the efficient and economical provision of medical services in the area. Presumably the agencies that control medical services in each area would conduct these elections. All of this seems so confused and muddled that even the British system by comparison is a veritable apotheosis of orderliness and logic. Since all such systems inevitably break down individual initiative and the desire of physicians to advance in their profession, an attempt is made to provide professional and financial incentives. The governing body would decide who gets them and for what, and who could go away and for how long to take postgraduate study and also who could take a vacation. Long, long ago a philosopher warned against the Greeks bearing gifts.

The proposed act does not make any positive statements as to the costs of the total service, but it does mention the percentage of the payroll that would be needed, according to the estimates of the authors, to make the act effective. It comes roughly to 3 per cent of the payroll. The message of the President was greeted by a majority of the American press with misgivings and doubts as to what it might do to medical care in our country. The *Washington Post* said plainly that the inability of the government to provide what it promised was apparent and that this was therefore a "gigantic fraud."

No doubt those who represent the American medical profession in any hearings that are held on this and related health measures will point out clearly to the appropriate committees of the House and the Senate the innumerable deficiencies and dangers that are so apparent in this monster measure. The public educational program of the American Medical Association will certainly inform the American people of the hazards to their individual health that would inevitably ensue on the passage of this bill. Unless a complete revolution in American thought, action and way of life should occur, the enactment of this measure would seem to be incredible.

HOSPITAL SERVICE IN THE UNITED STATES

The annual hospital report of the Council on Medical Education and Hospitals published in this issue of *THE JOURNAL* shows a new high in the utilization of hospital service in continental United States. The present bed capacity of 1,423,520 and the average daily census of 1,217,154 are nearly identical with the previous report, but the total of 16,422,772 admissions in 1948 represents an increase of 593,260 in the last year and exceeds also the earlier record of 16,257,402 in 1945. While increases occurred in both the governmental and the nongovernmental divisions, the expansion was not uniform throughout the hospital field. The federal hospitals, for example, reported a reduction of about 100,000 admissions, and the hospitals under "individual and partnership" control 33,000; yet the governmental institutions as a group had a net increase of 86,147 and the nongovernmental hospitals 507,113. The admissions, as here reported, do not include hospital births, which last year totaled 2,794,281 compared with the all time record of 2,837,139 in 1947.

The greatest increase in service was in the general hospitals, which reported 15,160,062 admissions and 2,715,645 births. These totals represent 92 per cent of all patients admitted and 97 per cent of the hospital births in 1948. Although the bed capacity of this group was reduced in the last year from 592,453 to 576,459, the number of admissions increased by 494,867. With an average daily census of 437,590 the general hospitals in 1948 carried 36 per cent of the daily patient load reported in all registered hospitals. The psychiatric hospitals with a capacity of 691,499 beds admitted 305,000 patients, an increase of 13,046 compared with the previous year. While this total represents less than 2 per cent of all admissions, the maintenance of an average daily census of 664,399 indicates that nearly 55 per cent of the occupied hospital beds are utilized for psychiatric care. An increase in tuberculosis hospitalization in the last year is apparent in the report of 105,588 admissions compared with 99,080 in 1947. The tuberculosis hospitals, which have a capacity of 81,993 beds, reported an average daily census of 66,484, or approximately 5 per cent of the total hospital load.

Although the number of beds remained practically unchanged in the last year, the increase in hospital admissions did not result in a proportionate gain in the percentage of beds occupied. This apparent discrepancy is clarified, however, by the reduced period of hospitalization in the general hospital group, to which 92 per cent of all patients were admitted. In 1947 the average patient in a general hospital remained 11.4 days, while in 1948 the average length of stay was 10.5. Last year the over-all hospital occupancy rate was 85.5 per cent as compared with 85.4 in 1947. The percentage in the governmental hospitals increased to 89.0 per cent, but there was a corresponding reduction in the nongovernmental hospitals to 76.7. The general hospitals

maintain an average occupancy of 75.9 per cent, but the increase to 96.1 in the psychiatric group indicates that many hospitals in this field operate well beyond their rated capacity.

While modern hospitals are primarily engaged in the care of the sick, they are also to an increasing degree participating in educational functions necessary to the maintenance of high standards of hospital service. The magnitude of this program is evident in the number of hospitals which have developed educational services for interns, resident physicians, student nurses and hospital technical personnel. Currently there are 807 hospitals approved for interns and 1,140 for the training of resident physicians. The accredited schools of nursing education, which now total 1,163, reported an enrolment of 100,174 student nurses in 1948. There are in addition 224 hospital schools approved for the training of x-ray technicians, 383 schools for medical technologists, 25 for occupational therapy technicians, 26 for physical therapy technicians and 13 for the training of medical record personnel. The generous support which these educational programs have received is a further contribution on the part of the hospital administration and the medical, nursing and technical staffs to the future needs of the hospital field.

Current Comment

TECHNICAL PERSONNEL

The technical schools approved by the Council on Medical Education and Hospitals continued to expand, particularly in the fields of medical technology and roentgen ray technic. Increased numbers of graduates were also observed in occupational therapy, but the reports did not show a corresponding gain in graduates concerned with physical therapy and medical records. The existing schools, even at their present stage of development, are not able, however, to supply the full needs of the expanding hospital field as well as the growing demand for technical personnel in doctors' offices, clinics, medical centers, health laboratories, governmental services, research laboratories and other beckoning fields. The student recruitment program must be further intensified with increased counseling at high school and college levels. Existing courses should be expanded to their full capacity, and additional schools should be developed in other hospitals, colleges and universities that are able to supply the necessary facilities and teaching personnel. Further attention should also be given to the establishment of preparatory courses in colleges and universities with the channeling of personnel into affiliated schools. Whenever possible, credit for time should be extended so that the period of practical hospital experience might be utilized in fulfilling the requirements for a degree. This plan has already been adopted in many centers and is functioning satisfactorily through the establishment of combined hospital and college or university courses. The growing interest in technical training

and the continued cooperation of schools and allied organizations give every indication that well qualified technical personnel will be available in increasing numbers to meet the expanding needs of the medical and hospital fields.

MATERNAL MORTALITY RATE AT A NEW LOW

The final tabulations of the number of births and maternal deaths in 1947 by the National Office of Vital Statistics indicate a new record low maternal mortality rate of 1.3 per 1,000 live births for the United States. The Summary of International Vital Statistics, 1937-1944, published by the National Office of Vital Statistics, does not cite any previous annual maternal death rate as low as the 1.3 achieved by the United States. Thus the maternal death rate for the United States in 1947 was the lowest reported for any nation, large or small, although rates for some nations since 1944 are not readily available. In 1933 the United States ranked eleventh among the leading nations in maternal mortality. The drop from 6.2 in 1933 to 1.3 in 1947, which amounted to 79 per cent, has undoubtedly raised the rank of the United States to first place or close to first place. No other nation has equaled the 79 per cent reduction recorded by the United States in the most recent period of the same duration for which data are available. The maternal mortality rate for whites was 1.1 and for nonwhites, 3.3. This contrasts with a rate in 1933 of 6.2 for the total population, 5.6 for whites and 9.7 for nonwhites. Thus in a period of a decade and a half the maternal mortality rate in the United States had dropped from 6.2 per thousand live births to 1.3. The maternal mortality rate by states is highly significant. Connecticut, Delaware, Iowa, Massachusetts, Minnesota, Oregon, Rhode Island, Utah and Wyoming reported a rate of less than 1.0 for 1947. The lowest rate was 0.6 for Minnesota. None of the states had a rate above 2.6. The phenomenal reduction in maternal mortality in the United States has not been restricted to any single state or group of states, but has been relatively uniform throughout the entire country. In 1933 none of the states had a maternal mortality rate lower than 4.3, while in 1947 no state had a rate higher than 2.6. In 1933 the spread in rates between the two states with the highest and lowest rates was 7.2 from 4.3 to 11.5; in 1947 the corresponding spread was only 2.0, from 0.6 to 2.6. The national maternal mortality rate for whites declined from 5.6 to 1.1 and for nonwhites from 9.7 to 3.3. Thus the declines for whites and nonwhites were 4.5 and 6.4 and the spread between the rates for whites and nonwhites declined from 4.1 (9.7-5.6) to 2.2 (3.3-1.1). It is also abundantly clear that this form of health progress has been extremely general throughout the United States during these fifteen years in which we rose from eleventh to first or second rank among the healthiest nations. This record on maternal mortality eloquently refutes the charge that large sections of the population of the United States are not enjoying the rapid health progress indicated by nationwide health statistics.

ORGANIZATION SECTION

STATEMENT ON TRUMAN HEALTH PLAN

Following is the text of the statement by Dr. Elmer L. Henderson, Chairman of the Board of Trustees of the American Medical Association, on President Truman's proposed national compulsory health insurance program:

President Truman's special message, asking enactment of a national compulsory health insurance program, deserves most careful scrutiny by Congress and by the American people, whose health would be seriously endangered if this Old World scourge is allowed to spread to our New World.

There is neither hope nor promise of progress in this system of regimented medical care. It is the discredited system of decadent nations which are now living off the bounty of the American people—and if adopted here it would not only jeopardize the health of our people but would gravely endanger our freedom. It is one of the final, irrevocable steps toward state socialism—and every American should be alerted to the danger.

One of the great dangers in political diagnosis of the health needs of the people is the temptation to oversimplification. President Truman has fallen into this error.

The President sets forth an objective which all of us can warmly endorse—namely, bringing adequate health services within the reach of all the people. The doctors of America, in cooperation with the prepaid medical and hospital care plans and the many splendid voluntary health insurance systems, have made great progress in achieving that objective, so we have no quarrel with the President on that score.

President Truman, however, proceeds from a desirable objective to a highly undesirable proposal for achieving that objective. There is a great deal of double talk in the President's message, but what he actually proposes is a national compulsory health insurance system which would regiment doctors and patients alike under a vast bureaucracy of political administrators, clerks, bookkeepers and lay committees.

Every wage earner, every self-employed person and every employer would be compelled to contribute exorbitant payroll taxes, eventually mounting to a tax of 8 or 10 per cent on every paycheck, to support this system—and the cost of medical care, instead of being reduced, would be doubled and trebled by bureaucratic overhead.

The record is clear in every country where compulsory health insurance has been adopted. It is cheap in quality, but extravagantly high in price.

The President's message, in some respects, was persuasive and disarming. The ideals and objectives were stated in glowing terms, but the message was completely lacking in any specific statement of the services to which the people would be entitled, or any estimate of the taxes which they would be compelled to pay.

Mr. Truman has been too long away from Missouri, if he believes the American people will sign a blank check for such an ambiguous program. The people will want to be shown.

There are many fallacies and misstatements in the President's message, some of which cannot go unchallenged.

President Truman, for example, is about a decade behind the times in his statistics on the growth of the voluntary health insurance systems.

He reports that only 3,500,000 people have insurance which provides adequate health protection. Ten or fifteen years ago that was true. Today, Mr. President, 55,000,000 Americans are protected under the voluntary health insurance systems of this country, against the costs of hospital care, and 37,000,000 policy holders are insured against surgical or medical bills.

Again, the President falls into the error of stating that only limited, inadequate health protection is available under the voluntary health insurance systems. Actually, the voluntary

systems are providing better coverage today than any compulsory program yet proposed—at about half the price.

President Truman also makes the amazing assertion that adequate medical care is now beyond the means of all but the upper income groups. On the contrary, any family which can afford a package of cigarettes a day, or a weekly movie, can afford the finest kind of prepaid medical and hospital protection. The cost is about the same.

The most serious misstatement in the President's message—and one which it is regrettable any President of the United States would have uttered—is the repetition of that now completely discredited statement that tens of thousands of persons die needlessly in this country, due to lack of medical care.

The President, in this instance, as in others, undoubtedly based his statement on the distorted report of the Federal Security Administrator, whose listing of "needless deaths" included 40,000 deaths from accidents and 115,000 from cancer and heart disease.

It is shocking that any Government department head would seek to impose on the credulity of the American people with such flagrant misrepresentations—and it is unfortunate, indeed, that the President of the United States should have repeated, even in part, the misinformation contained in this report.

There is a very real need in America for the budgeting of medical costs, and American medicine is proud of the part it has played in building the voluntary health insurance systems to meet that need. There is no need, however, for compelling the American people to join a government system.

The voluntary way is the American way—and the people will resolve this problem, in a very short span of years, under the voluntary systems now available to them.

THE PRESIDENT'S NEW NATIONAL HEALTH BILL

A Condensation Prepared by the Bureau of Legal Medicine and Legislation, American Medical Association, April 28, 1949

A new administration national health bill, apparently offered as a substitute for S.5, was introduced in the Senate, April 25, as S. 1679, by Senators Thomas of Utah, Murray of Montana, Wagner of New York, Pepper of Florida, Chavez of New Mexico, Taylor of Idaho, McGrath of Rhode Island and Humphrey of Minnesota. The bill was referred to the Committee on Labor and Public Welfare, of which Senator Thomas is Chairman.

Similar bills were introduced on the same day in the House of Representatives as H.R.4312 by Representative Dingell of Michigan and H.R.4313 by Representative Biemiller of Wisconsin. The House bills were referred to the Committee on Interstate and Foreign Commerce, of which Representative Crosser of Ohio is Chairman.

The title of the bill indicates that it will provide a program of national health insurance, and its proponents describe the program as constituting a national system of contributory health insurance.

There are seven titles to the one hundred and sixty-three page bill.

Prepaid Personal Health Insurance Benefits

This is the heading assigned to Title VII of the bill.

Administration.—On the federal level, there will be created in the Federal Security Agency a National Health Insurance Board of five members, three of whom will be appointed by the President by and with the advice of the Senate. The other two will be the Surgeon General of the United States Public Health Service and the Commissioner of Social Security. None of the appointed members, one of whom will be a licensed

doctor of medicine, will be permitted to engage in any other business, vocation or employment. The President will designate one of the appointed members as chairman of the board.

All functions of the board will be administered under the direction and supervision of the Federal Security Administrator. It will be authorized to make all necessary and permissible regulations. It may delegate all of its powers and duties, except the power to make regulations, to any of its members, officers or employees, or, if the Administrator agrees, to any other officer or employee of the Federal Security Agency.

There will be a National Advisory Medical Council. It will advise the board concerning matters of general policy and administration arising in connection with the making of regulations, the establishment of professional standards and the performance of its other duties. The chairman of the board will serve as chairman of the council, and sixteen additional members will be appointed by the Federal Security Administrator. Of the appointed members, at least eight must be persons familiar with medical and professional health services in urban or rural areas and must be representative of the interests of persons eligible for benefits, and at least six must be persons who are outstanding in the medical or other professions concerned with the provision of services provided as benefits and who are representative of the persons and organizations by whom services will be provided. The council would be authorized to appoint special advisory technical or professional committees.

On a state level, an approvable state plan must designate a single state administrative agency, and the bill suggests that that agency should be the state agency, so far as feasible, which administers or supervises the administration of the state's general public health and maternal and child health programs. The state must be divided into local health areas and the plan must provide for a decentralized administration of the program to such areas. A state advisory committee must be created to include members familiar with personal health needs in urban and rural areas and a majority of whom must be representative of the interest of persons eligible for benefits, and members chosen from the several professions, hospitals and other organizations in the state by whom such benefits will be provided. This advisory committee must make surveys of the resources and needs of the state and formulate a program for the administration of the benefits which gives reasonable assurance (1) that maximum use will be made of all available health personnel and facilities desiring to participate in the program, (2) that the method of allotting funds will give reasonable assurance of the availability of services in all health service areas and (3) that any maldistribution or other inadequacies in health personnel and facilities or in the quality of the services rendered will be progressively improved as rapidly as may be practicable. The state agency must make such reports to the federal board as it may require and must, on demand, give the board access to records.

A state plan must provide for cooperation, including, where necessary, entering into working agreements with other public agencies of the state or of its political subdivisions concerned with programs related to the purposes of this title, and with appropriate agencies of other states or of the United States administering this title, or benefits under it, in other states.

On a local level, there will be for each health service area a local administrative committee or, if a state so decides, a local administrative officer who will act with the advice and assistance of a local advisory committee to consist of not less than eight nor more than sixteen members. A majority of members must be representative of the interest of persons in the area who are eligible for benefits. The remaining members must be chosen from the several professions, hospitals and other organizations in the area by whom the benefits will be provided. Local administrative officers and committees will be appointed by the state agency. They will be required to make readily available to eligible persons in the area lists of the names of all persons who have agreed to furnish services, together with the class or classes of services which each has undertaken to furnish. They must disseminate pertinent information concerning the rights and privileges of eligible persons and of persons qualified to furnish personal health services and benefits. They will be required to maintain effective relationships with physicians, dentists, nurses and other persons who have entered into agreements to furnish services in the area in order to facilitate the furnishing of services in accordance with such agreements, to assure full and prompt payment for services furnished and to enlist their full cooperation in the administration of benefits.

Local professional committees are to be appointed, the members of which will be selected in accordance with methods set forth in a state plan, as will also the members of local advisory committees.

If a state has not, prior to July 1, 1950, an approved plan of operations, the board must notify the governor of a state that it will be required to administer the title in the state, commencing July 1, 1951. The board must publish such notice in at least two newspapers in the state. If within sixty days after such notification to the governor, the state has not submitted an approvable plan, the board will undertake the administration of the title, commencing July 1, 1951, and will continue such administration until one year after the submission and approval of a state plan of operations.

Fiscal Provisions.—There will be created on the books of the Treasury of the United States a separate account to be known as the "Personal Health Services Account," the funds in which will be used to finance the program. While reference has been made in press releases and over the radio to a tax on employers and employees on wages paid or received, up to and including \$4,800 a year, to provide revenue for the program, no such reference is contained in the bill. On the contrary, it provides that there shall be appropriated to the account for the fiscal year ending June 30, 1952 and for each fiscal year thereafter (1) sums equal to 3 per cent of all wages, up to and including \$4,800, estimated to be received during the fiscal year; (2) sums equal to the estimated cost of furnishing dental services and home nursing services during the fiscal year, and (3) any further sums required to meet the expenditures to carry out the title.

From this account will be made allotments to the states in accordance with a formula set forth in detail in the bill.

There will also be appropriated to the account in the fiscal year 1951 a sum equal to 1 per cent of the wages estimated to be received during the fiscal year, to constitute a reserve account for use in case of a disaster, epidemic or in case of any other cause which substantially increases, over the anticipated volume, the volume of service benefits required in any part of the United States.

The bill also authorizes for the fiscal year 1952 the sum of \$10,000,000, for the fiscal year 1953 the sum of \$15,000,000 and for each fiscal year thereafter an amount not to exceed 0.5 per cent of the amount expended for benefits in the last preceding calendar year, to be used in the training and education of professional and technical personnel engaged or undertaking to engage in the provision or administration of personal health services.

Eligibility for Benefits.—The requirements that must be met by a person to qualify him for benefits under the program are set forth in detail, such as, for example, the amount of compensation he must have received during the first four of the last six calendar quarters preceding the beginning of the benefit year. Noninsured needy and other persons may become entitled to benefits for any period for which equitable reimbursements to the account on behalf of such persons have been made or assured by public agencies of the United States, the several states or any of them or of their political subdivisions. No person otherwise eligible for benefits which are required by reason of any injury, disease or disability for which benefits are provided under the workmen's compensation law may receive benefits under the title unless equitable reimbursements are made to the Personal Health Services Account.

Participation of Physicians, Dentists, Nurses, Hospitals and Others.—Any licensed physician or dentist will be qualified to render services under this program. Any person found to possess skill and experience of a degree and kind sufficient to meet standards, established by the federal board, for a class of specialist services will be qualified to receive compensation for specialist services. Similar provisions obtain with respect to nurses and hospitals and for persons rendering auxiliary services. Agreements may be made, apparently by the state agency, with any organized group of physicians, any partnership, association or consumer cooperative, any hospital or any hospital and its staff, or any organization operating a voluntary health service insurance plan or other voluntary health service plan to render the services contemplated by this title.

Classes of Personal Health Services to be Made Available.—The personal health services that are to be made available as benefits are medical services, dental services, home nursing services, hospital services and auxiliary services. Medical

services will consist of (1) general medical services such as can be rendered by a general practitioner, including preventive, diagnostic and therapeutic care and periodic medical examinations, and (2) specialist services rendered by a physician who has been found to be a specialist by the federal board. These services may be rendered at the office, home, hospital or elsewhere, as necessary. Similar provisions are contained with respect to dental services and home nursing services. Payments for hospital services will be based on the least expensive multiple bed accommodations available in the hospital unless the patient's condition makes the use of private accommodations essential for his proper medical care. The federal board, after consultation with the Advisory Council and with representatives of interested hospital organizations, may by regulation prescribe maximum rates for hospitalization. Hospital services will not include hospitalization in a mental or nervous disease or tuberculosis hospital or institution, or hospitalization for any day more than thirty days following the diagnosis of tuberculosis or a psychosis.

Auxiliary services will consist of such chemical, bacteriologic, pathologic, diagnostic roentgenologic and related laboratory services, roentgen ray, radium and related therapy; physical therapy, services of optometrists and chiropodists and prescribed drugs which are unusually expensive, special appliances and eyeglasses, as the federal board, after consultation with the Advisory Council may, by regulation, designate. The board may, in addition, and again after consultation with the Advisory Council, if it finds that the personnel or facilities or funds that are or can be made available are inadequate to insure the provision of all services included as dental, home nursing or auxiliary services, may by regulation limit for a specified period such services.

The federal board must study and make recommendations as to needed services and facilities for the care of the chronic sick and for the care of persons afflicted with mental or nervous diseases, and as to needed provisions for the prevention of such conditions.

Free Choice by Beneficiaries.—The bill promises that each eligible beneficiary may select the physician, dentist, nurse, medical group, hospital or other person of his choice to render the services to which he will be entitled, provided the selectee has agreed to furnish the class of services required and consents to furnish the services to the beneficiary. The services of specialists, home nursing, hospital and auxiliary services may be obtained whenever the practitioner from whom the beneficiary is receiving medical or dental benefits refers him for such services, or whenever, on the request of the beneficiary, the administrative medical officer refers him for such services. The federal board is authorized by regulation to dispense with the necessity of referral in cases of emergency.

Payment for Services.—Agreements for the furnishing of medical or dental services must provide for payment (1) on the basis of fees for services rendered, according to a fee schedule (the bill is not clear as to who will prepare this fee schedule); (2) on a per capita basis, depending on the number of persons eligible for benefits who are on the practitioner's list; (3) on a salary basis, whole time or part time, or (4) on such combinations or modifications of these bases as may be approved by the state agency. The particular method of compensation, apparently, will be determined in each health service area as the majority of the medical practitioners or of the dental practitioners may elect. Practitioners who do not elect the method selected by the majority may be paid in accordance with another method if such alternative method promotes the efficient and economical provision of medical or dental services in the area.

With respect to the payment of specialists, agreements may provide for payments on the basis of fee for service, per case, per session, per capita, salary or other basis.

In any health service area where agreements provide for payment only on a per capita basis, the per capita payments with respect to those persons who have failed to select a practitioner or other person will be made on a pro rata basis among the practitioners and other persons under agreement to furnish services in the area.

Amount of Payments for Services.—Fees for particular services or classes of services will be adapted to take account of relevant regional, state, or local conditions and practices. In arriving at such fees, regard must be had for the annual income or its equivalent which the payments will provide, and to the degree of specialization, and to the skill, experience and responsibility involved in rendering the services. The fees must be adequate to provide professional and financial incentives

to practitioners to advance in their professions and to practice in localities where their services are most needed, to encourage high standards in the quality of services furnished, to give assistance in their use of opportunities for postgraduate study and to allow for adequate vacation; at least the bill so provides.

Panel Limits.—Maximum limits on the number of eligible persons with respect to whom any person may undertake to render services may be fixed by the local administrative committee or local administrative officer, on the basis of a recommendation of the professional committee in that area that such limitation is necessary.

Free Choice by a Physician.—A physician who enters into any agreement to furnish services to beneficiaries may terminate such agreement after reasonable notice and after suitable arrangements are made to fulfil professional obligations to eligible persons. The bill acknowledges his right to practice his profession in the locality of his own choosing and his right to accept or reject as a patient any person requesting his services.

Education of Health Personnel

Title I of the bill proposes federal aid for education in the medical, dental, dental hygiene, public health, nursing, sanitary engineering, hospital administration and related professions. It will authorize appropriations to assist schools in repairing and enlarging existing equipment. Additional appropriations will be made available for the construction of new schools.

For each fiscal year there will be authorized to be appropriated such sums as may be necessary to assist these schools to maintain and increase their enrolment of students. For the fiscal year ending June 30, 1950, and for each of the two succeeding fiscal years payments will be based on the number of students enrolled for such fiscal year. To each school of medicine \$300 will be granted for each student enrolled for such training up to its average past enrolment and \$1,700 for each student so enrolled in excess of that average. Similar payments for schools of dentistry, nursing, public health and schools of engineering offering courses in sanitary engineering will be authorized.

To obtain federal funds to aid in the costs of instruction and for construction and equipment, a school must file an application and give adequate assurance that conditions outlined in the bill will be observed.

Federal funds will be made available for payments to states to cover the costs of state scholarships awarded in each of the health fields. States must submit a plan for scholarships. A person receiving a scholarship must agree, among other things, to serve, on completion of his training, including internships and residencies, one year for each two academic years during which he received the benefit of the scholarship (1) in the rendition of service in an area designated by the state agency as one in need of additional personnel or (2) with the approval of the state agency, in the practice of his profession on full time active duty in a medical agency or unit of the United States Government.

There will be created a National Council on Education for Health Professions, consisting of the Surgeon General as chairman, the Commissioner of Education or his representative, the chief medical officer of the Veterans' Administration or his representative, a medical representative designated by the Secretary of Defense and twenty members appointed by the Surgeon General with the approval of the Administrator. Special advisory and technical committees may be appointed by the Surgeon General. Regulations with respect to payments authorized under this title to the various schools, and to the states, will be made apparently by the Surgeon General after consultation with the council.

Medical Research

Title II would authorize the Surgeon General of the United States Public Health Service with the approval of the Administrator to establish in the service institutes to conduct and support scientific research and professional training relating to the cause, prevention and methods of diagnosis and treatment of poliomyelitis, diabetes, arthritis and rheumatism, multiple sclerosis, cerebral palsy, epilepsy and other diseases or groups of diseases. Assistance may be given, too, to such researches conducted by public and private agencies. The creation of national advisory councils in relation to each of such diseases would be authorized.

Hospital Survey and Construction

Title III provides for an extension of the duration of the provisions of the Federal Hospital Survey and Construction Act until June 30, 1957, and will increase the amount authorized

to be allotted to the states for assisting and meeting the costs of construction of hospitals. It would also increase the amount of federal participation in the costs of construction of projects. It would specifically include in the building program a provision for the construction of facilities for group medical and dental practice and would authorize studies concerning the coordinated use of hospital facilities on a regional area basis.

The title would specifically authorize the Surgeon General to conduct research experiments and demonstrations relating to the effective development and utilization of hospital services, facilities and resources and, after consultation with the Advisory Council, to make grants-in-aid to states, political subdivisions, universities, hospitals and other public or private nonprofit institutions or organizations for projects for the conduct of research, experiments or demonstrations relating to the development, utilization and coordination of hospital services, facilities and resources.

Special Aid for Rural and Other Shortage Areas

The next title, number IV, proposes through grants and loans to expedite the location of physicians, dentists, nurses, hospitals, clinics and other requisites for medical service in areas which are short of such personnel and facilities. Grants may be made to aid in maintenance and operation of local facilities for group practice, health centers, clinics and hospitals. Loans, repayable in ten years, may be made for the cost of facilities, including construction and durable equipment, and grants and loans repayable in ten years may be made for the cost of construction and equipment of health centers or clinics for diagnostic, preventive or curative services, or of facilities for group practice. Loans may also be made for the construction of health centers, clinics and hospitals, and provision may be made for mobile clinics and for such ambulance service as necessary. Apparently the provisions of this title relating to loans and grants for the construction of hospitals or clinics will be tied in with the state plan that has been developed under the federal hospital survey and construction act.

Assistance will be given to farmers' cooperatives in selected rural areas to initiate and carry out experimental plans for providing comprehensive medical care for their members, as a means of demonstrating the practicality and effectiveness of such plans. For this purpose there will be authorized to be appropriated for the fiscal year ending June 30, 1950, the sum of \$10,000,000 and for each of the four succeeding fiscal years the sum of \$15,000,000.

Grants to States for State and Local Health Work

Title V would assist the several states in developing, extending and improving (1) basic state and local health organizations and the basic services provided thereby, (2) health services to the extent not otherwise available under title VII of the bill, for the prevention, treatment and control of disease, including services for the prevention, treatment and control of mental illness, tuberculosis, venereal disease, cancer, heart disease, other chronic diseases, disorders associated with aging, dental disorders, nutritional deficiency diseases, occupational and other diseases which constitute special health problems and services for the improvement of sanitation and other environmental factors affecting health and (3) the training of personnel for state and local health work and methods for extending health services throughout each state.

Research in Child Life and Grants to States for Maternal and Child Health and Crippled Children's Services

Title VI authorizes federal funds for investigation and report on all matters relating to the welfare of children and child life. Grants-in-aid to institutions, agencies and individuals are contemplated for research projects relating to the development of children and community aspects of child life. Research fellowships will also be established and maintained. A National Advisory Council on Research in Child Life will be created.

Additional funds will be made available to enable each state to extend and improve (1) the physical and mental health of mothers during maternity, of infants and of children under 18 years of age, particular attention being given to the correction in children of preschool and school age, defects likely to interfere with their normal development and educational

progress and (2) services and facilities for locating crippled or otherwise physically handicapped children under 21 years of age or children under such age who are suffering from conditions which lead to crippling or physical handicap and for providing medical, surgical, corrective, dental and other services and care, including diagnosis, treatment, hospitalization, after-care, appliances and whatever health services and facilities are needed for such children.

PREPAYMENT MEDICAL CARE

Report of the Council on Medical Service of the American Medical Association April 15, 1949

The rapid and orderly growth of voluntary prepayment medical and hospital care plans has been one of the striking and stimulating economic developments supported by American medicine during the past fifteen years. The initiating and propelling force of these plans was the medical profession acting through its local and state societies and later its national organization. This movement has attained national proportions. At the present time over 30,000,000 persons are covered by Blue Cross type hospital insurance and over 10,000,000 by Blue Shield type medical care insurance. This stimulus and the accumulated experience gained by these organizations have prompted many private insurance companies to enter this field, and they are making substantial contributions toward the accomplishment of our ultimate objective; namely, voluntary health insurance at a nominal cost for all the people in the United States. The total number of persons covered by all voluntary agencies is 55,000,000 for hospitalization and 37,000,000 for surgical or medical care.

The American Medical Association is not engaged in the insurance business and has no intention of giving a preferential standing to any one type of voluntary plan. The American Medical Association does believe, however, that it has a definite function to perform, that of evaluating any insurance plan presented to the people, thus protecting them as far as possible against unscrupulous or unsound plans. The American Medical Association further believes that the people should be free to purchase the type of health security they desire. To this end the Council on Medical Service has for the past four years critically examined various plans and has given its approval to numerous plans operating on a local or state basis. The Council has felt the need for a national organization which would act as a trade and coordinating agency for all medically sponsored plans.

We therefore recommend:

1. The formation of a national coordinating agency representing all qualified voluntary prepayment plans in accordance with the proposal made to the Board of Trustees by the Council on Medical Service.
2. That there shall be no official connection between the American Medical Association and the Associated Medical Care Plans. However, the American Medical Association will continue to approve or disapprove all voluntary medical care plans.
3. The recognition of the Associated Medical Care Plans as a trade organization of member plans and Blue Cross as occupying a similar position for voluntary prepayment hospital care plans.
4. The recognition of the responsibility of the American Medical Association to
 - A. Promote the principle of voluntary insurance by educating the people as to their need for such coverage and by obtaining full cooperation from state and county medical organizations in the local field.
 - B. Inform the American people of the availability of approved plans that propose to supply on a prepayment basis security against the economic hazards of serious illness.

RESOLUTIONS TO BE PRESENTED TO HOUSE OF DELEGATES AT ATLANTIC CITY SESSION

The Secretary of the Association has received the following resolutions, which he has been informed will be presented to the House of Delegates for action at the Atlantic City Session in June by the delegates of the Rhode Island Medical Society and the Connecticut State Medical Society respectively:

RESOLUTION ON DISPLACED PHYSICIANS

(Adopted by the House of Delegates of the Rhode Island Medical Society, Jan. 19, 1949)

WHEREAS, It is generally admitted that there is a need for more qualified physicians than are now available in this country; and

WHEREAS, There is at present a large group of physicians who, with their countrymen, have been rendered homeless and are now living as displaced persons under the care of the International Refugee Organization in Western Germany and elsewhere; and

WHEREAS, Many of the physicians are known to be highly trained specialists and practitioners; and

WHEREAS, Many of these physicians have entered the United States and many more will be resettled throughout the civilized world including the United States; therefore be it now

Resolved, That a special Committee on Displaced Physicians be appointed by the President of the American Medical Association, to consist of six members, whose duty it shall be to study the problems of displaced physicians generally and as far as possible to cooperate with the International Refugee Organization and the various state authorities in furthering the resettlement of these persons in a spirit of friendly cooperation with unfortunate colleagues.

RESOLUTION ON GENERAL PRACTITIONER'S AWARD

(Adopted by the House of Delegates of the Connecticut State Medical Society, Dec. 9, 1949)

WHEREAS, There are no proper and adequate criteria set forth for the qualifications for the Outstanding General Practitioner; and

WHEREAS, No practical method of choice exists; and

WHEREAS, Any choice would of necessity be arbitrary and in most instances, by inference, reflect unfavorably on those not chosen; and

WHEREAS, It has been voted to disapprove the annual selection of an Outstanding General Practitioner within Connecticut or throughout the country; therefore be it

Resolved, That the delegates from the Connecticut State Medical Society to the House of Delegates of the American Medical Association be instructed to introduce this resolution before the House of Delegates of the American Medical Association at its annual meeting in 1949 and to oppose the continuation of the annual General Practitioner's Award by the Association.

The following resolutions have been received from a delegate of the California Medical Association, who states that he expects to introduce them at the Atlantic City Session:

RESOLUTION ON GOVERNMENT COMPETITION WITH PRIVATE ENTERPRISE

WHEREAS, America is the product of a people's faith in constitutional law designed to protect the property and enterprises of each citizen from political competition or confiscation; and

WHEREAS, Attacks on this principle have produced many governmental agencies which are now in active conflict with the individual enterprises of the American people; and

WHEREAS, Many proposals now before Congress will, if adopted by a mere majority, further jeopardize the rights of the American people to their individual property and enterprises; and

WHEREAS, The intent and purpose of the Tenth Amendment to the Constitution was to prohibit governmental exercise of powers not specifically delegated to it; and

WHEREAS, The intention of the Fifth Article of the Constitution was to provide a means for the proper delegation of powers to government through a procedure which requires a two thirds majority of both houses of Congress and the approval of three quarters of the states; therefore be it

Resolved, That we, the members of the American Medical Association House of Delegates in regular session assembled this . . . day of June, 1949, exercise our Constitutional power to petition the Congress to preserve the intent and purposes of the Constitution by initiating an amendment to the Constitution, for submission to the people of the various states, to provide that:

The Government of the United States shall not engage in any business, professional, commercial or industrial enterprise in competition with its citizens except as specified in the Constitution; and be it further

Resolved, That a copy of these resolutions be spread on the minutes of this meeting, and that copies of it be sent to (1) the President of the United States, (2) members of the United States Senate, (3) members of the House of Representatives, (4) the Governors of the States, and (5) two copies to the American Progress Foundation, 569 I. W. Hellman Building, 124 West 4th St., Los Angeles 13, for the record of American vigilance being compiled.

Washington Letter

(From a Special Correspondent)

May 2, 1949.

Administration Drive for Compulsory Plan Under Way

President Truman's special message of April 22 was the signal for opening an intensive campaign in behalf of compulsory health insurance. Three key points of the drive are the White House, Congress and the Federal Security Agency. Within a matter of days, the President's request for Congressional enactment of the payroll tax plan had been followed up by introduction of the Administration bill (S.1679 in the Senate, H.R.4312 in the House), radio speeches in support, a press conference by Congressional sponsors, a statement by Senator Pepper and out of town speeches by Acting Federal Security Administrator J. Donald Kingsley and Assistant Administrator John Thurston.

However, the only unexpected development was the acceptance by Senator Thomas (Democrat, Utah) of the invitation to be chief sponsor of the Administration bill. Although the chairman of the Labor and Public Welfare Committee is an avowed Roosevelt "New Dealer," he had never previously committed himself on this sickness insurance issue.

At the press conference, Senator Thomas was asked point blank whether he favors compulsory health insurance. He replied that he most decidedly does. Senator Murray added that the fact that the committee chairman is the prime sponsor of S.1679 means that it is the Administration's bill. Other co-sponsors, besides Murray, are Senators Wagner, Pepper, Chavez, Taylor, McGrath and Humphrey. In the House, the leader in the fight for enactment of the bill is Representative John D. Dingell (Democrat, Mich.). Inasmuch as Senator Wagner is no longer active in Congress, the measure probably will become known as the Thomas-Murray-Dingell bill. Previous versions have been called the Murray-Wagner-Dingell bill.

Hearings on Health Legislation Scheduled

Public hearings on health legislation, which are expected to continue with little or no interruption until the end of the present session of Congress, have been scheduled by the Senate Labor and Public Welfare Committee. Plans of the Murray health subcommittee are to attempt to dispose of comparatively noncontroversial bills before taking up the national health insurance issue.

May 3 was designated for hearing of testimony on the Tobey bill (S.102) to stimulate multiple sclerosis research. The Langer bill (S.659) on epilepsy was set for hearing May 4 and the Neely bill on cerebral palsy (S.1538) May 5. On May 9, the arthritis research measure (S.705), sponsored by Senators Pepper, Murray, Chavez and Magnuson, is scheduled for hearing.

Witnesses will be asked to express their views on S.1651, introduced by Senator Magnuson, which is similar in principle to the special disease bills listed but which would leave the establishment of special institutes within the United States Public Health Service to the Surgeon General's discretion.

A special subcommittee headed by Senator Hill will hold hearings May 4, 5 and 9 on S.614, to amend the Hill-Burton hospital construction act by doubling federal contributions to \$150,000,000 annually and liberalizing the law's fund-matching provisions. On May 10 the subcommittee will hold hearings on S.522, which would authorize expansion of government aid to the states for improvement of local public health units.

Once public hearings are launched by the Murray subcommittee on the major national health bills—S.1456, S.1581 and S.1679—they are expected to last about six weeks, according to the chairman.

Dr. Dean Will Receive Gorgas Award

The Association of Military Surgeons of the United States has selected Dr. H. Trendley Dean, director of the National Institute of Dental Research, to receive the Gorgas Award for 1949 "for outstanding contributions in the field of military medicine." It will be presented at the association's annual meeting in Washington on November 11.

Medical Legislation

STATE LEGISLATION

California

Bill Introduced.—S. 36, to amend the business and professions code, proposes that a physician and surgeon whose name appears on the eligible list for state civil service is not required to hold a physician's and surgeon's certificate issued by the board in order to practice medicine as an employee of the state within state institutions, prisons or homes, provided that before such person is certified the state personnel board shall obtain from the board of medical examiners a certificate that the person is eligible to take the examination for physician's and surgeon's certificate under the provisions of the law.

Colorado

Bill Enacted.—S. J. Res. 26 was adopted April 19, 1949. It creates a commission with authority to investigate the functions, organizations, policies, procedures and operations of all state institutions.

Connecticut

Bill Introduced.—H. 1625 proposes to permit the practical training of medical and dental students, prior to their receiving licenses to practice their respective professions. The training may be given under the supervision of a licensed dentist or physician in a dental or medical school or in a hospital, infirmary, clinic or dispensary affiliated with such school.

Bill Enacted.—H. 467 has become Special Act No. 22 of the Acts of 1949. It provides that in order to promote uniformity in diagnostic laboratory work throughout the state, the commissioner of health may purchase serologic reagents, test such reagents for standard quality and distribute them at cost price to laboratories approved by the department for use in performing tests for which approval has been extended.

Florida

Bills Introduced.—H. 83, relating to the qualifications of the state health officer, proposes that he shall be a physician who shall be an expert in diagnosis of infectious, contagious and communicable diseases, and who must be a person of recognized ability with no less than four years of experience in public health work with a public agency; he shall be skilled in hygiene, sanitary science and a graduate of a school of medicine recognized by the Council on Medical Education of the American Medical Association and licensed by the state board of medical examiners as a medical doctor. H. 187 and S. 107 propose to authorize the board of commissioners of state institutions to acquire a site for a hospital for the treatment of chronic alcoholic addicts and to erect thereon and equip such a hospital. H. 306 proposes to authorize the use in evidence, where a defendant is charged with being under the influence of intoxicating liquor, of the results of a chemical analysis of the defendant's blood, breath, urine or other bodily substance. H. 312 and S. 180 propose the creation of a Florida board of medical technology and define medical technology as the science, art or technique of performing any laboratory tests or examination on or of the blood, blood serum, feces, urine, sputum, exudates, transudates, organ contents or any by-products thereof, from the human body, living or deceased, the results of which are used or interpreted by a practitioner of the healing arts in the practice of his profession. S. 109 proposes that it shall be unlawful for any person to practice naturopathy in the state of Florida and proposes further that any license or authority to practice naturopathy granted by any board or authority is declared to be void. S. 112 proposes an appropriation to the state tuberculosis board for acquiring sites and for constructing and equipping tuberculosis sanatoriums. S. 175 proposes an appropriation to the state board of health to conduct research relative to the causes, prevalence and prevention of diabetes and to distribute information obtained therefrom to the public.

Maine

Bill Introduced.—H. 309 proposes that the use of electrolysis for the removal of hair is not a part of the practice of hairdressing and beauty culture and is prohibited except under the direction of a licensed physician.

Massachusetts

Bills Introduced.—S. 620 App. B proposes the creation of a commission for the purpose of making an investigation and study relative to supplying to licensed institutions unclaimed and unwanted animals which are held in the public pounds, the making of records of animals obtained by institutions for experimentation, the advisability of the commonwealth's making available to dog owners a method of permanently identifying and licensing their dogs and the making of such regulations for the care and treatment of animals under medical control for experimentation purposes as will insure the minimum of suffering consistent with the safeguarding of public health and the advancement of medical and surgical science. S. 622 proposes the appointment of an unpaid commission to make an investigation and study relative to the department of mental health and the institutions under the control of said departments.

Rhode Island

Bill Introduced.—S. 359, to amend the medical practice act, proposes that any person graduated with the degree of doctor of medicine who has served an internship or residency in a Rhode Island hospital during the period of the national emergency from Dec. 7, 1941, to Dec. 31, 1946, shall be admitted to examination for licensure for medicine in the state.

Coming Medical Meetings

American Medical Association, Atlantic City, June 6-10. Dr. George F. Lull, 535 N. Dearborn St., Chicago 10, Secretary.

American Academy of Neurology, French Lick, Indiana, French Lick Springs Hotel, June 1-3. Dr. Joe R. Brown, 19 Millard Hall, University of Minnesota, Minneapolis 14, Secretary.

American Academy of Tuberculosis Physicians, Atlantic City, Hotel Dennis, June 4. Dr. Oscar S. Levin, P. O. Box 7011, Denver 6, Colo., Secretary.

American Association of Genito-Urinary Surgeons, White Sulphur Springs, W. Va., Greenbrier Hotel, May 9-11. Dr. Norris J. Heckel, 122 S. Michigan Ave., Chicago 3, Secretary.

American Association of Railway Surgeons, Chicago, Drake Hotel, June 30-July 2. Dr. Chester C. Guy, 5800 Stonely Island Ave., Chicago 37, Secretary.

American Association of the History of Medicine, Lexington, Ky., Lafayette Hotel, May 23-24. Dr. Benjamin Spector, 416 Huntington Ave., Boston 15, Secretary.

American College of Radiology, Atlantic City, Chalfonte-Haddon Hall, June 5. Mr. William C. Stronach, 20 N. Wacker Drive, Chicago 6, Secretary.

American Dermatological Association, Hot Springs, Va., May 23-26. Dr. Louis A. Brunsting, 102 Second Ave. S.W., Rochester, Minn. Secretary.

American Gastro-Enterological Association, Atlantic City, Claridge Hotel, June 3-4. Dr. Dwight L. Wilbur, 655 Sutter Street, San Francisco 2, Secretary.

American Gaiter Association, Madison, Wis., Hotel Loraine, May 26-28. Dr. Thomas C. Davison, 478 Peachtree St., N.E., Atlanta 3, Ga., Secretary.

American Laryngological Association, New York, May 16-17. Dr. Louis H. Clerf, 1530 Locust St., Philadelphia, Secretary.

American Neurological Association, Atlantic City, June 13-15. Dr. H. Houston Merritt, 710 W. 168th St., New York 32, Secretary.

American Ophthalmological Society, Hot Springs, Va., The Homestead, June 2-4. Dr. Maynard C. Wheeler, 30 W. 59th St., New York, Secretary.

American Orthopedic Association, Colorado Springs, May 18-21. Dr. C. Leslie Mitchell, Henry Ford Hospital, Detroit 2, Secretary.

American Otological Society, New York, May 18-19. Dr. Gordon D. Hoople, 713 E. Genesee St., Syracuse, N. Y., Secretary.

American Proctologic Society, Columbus, Ohio, May 31-June 4. Dr. W. Wendell Green, 1838 Parkwood Ave., Toledo 2, Ohio, Secretary.

American Psychiatric Association, Montreal, Canada, May 23-27. Dr. Leo H. Bartemeier, General Motors Bldg., Detroit 2, Secretary.

American Radium Society, Atlantic City, June 5. Dr. Hugh F. Hare, 605 Commonwealth Ave., Boston 15, Secretary.

American Therapeutic Society, Atlantic City, June 2-5. Dr. Oscar B. Hunter, 915 Nineteenth St. N.W., Washington, D. C., Secretary.

American Urological Association, Los Angeles, Hotel Biltmore, May 16-19. Dr. Thomas D. Moore, 899 Madison Ave., Memphis 3, Tenn., Secretary.

Arizona State Medical Association, Tucson, May 8-10. Dr. Frank J. Milloy, 15 E. Monroe St., Phoenix, Secretary.

Association for the Study of Internal Secretions, Atlantic City, June 3-4. Dr. Henry H. Turner, 1200 N. Walker St., Oklahoma City 3, Secretary.

California Medical Association, Los Angeles, May 8-11. Dr. L. Henry Garland, 450 Sutter St., San Francisco 8, Secretary.

Georgia Medical Association of Savannah, Hotel De Soto, May 10-13. Dr. Edgar D. Shanks, 478 Peachtree St., N.E., Atlanta, Secretary.

Idaho State Medical Association, Sun Valley, June 20-23. Dr. Alfred M. Popma, 220 N. First St., Boise, Secretary.

Illinois State Medical Society, Chicago, Palmer House, May 16-18. Dr. Harold M. Camp, 224 S. Main St., Monmouth, Secretary.

International Congress on Rheumatic Diseases, New York, Hotel Waldorf-Astoria, May 30-June 3. Dr. Philip S. Hench, Mayo Clinic, Rochester, Minn., Chairman, American Committee.

Kansas Medical Society, Topeka, May 9-12. Dr. D. D. Vermillion, 512 New England Bldg., Topeka, Secretary.

Maine Medical Association, Poland Spring, Poland Spring House, June 19-21. Dr. Frederick R. Carter, 142 Hight St., Portland 3, Secretary.

Massachusetts Medical Society, Worcester, May 24-27. Dr. H. Quimby Gallupe, 8 Fenway, Boston 15, Secretary.

Minnesota State Medical Association, St. Paul, Municipal Auditorium, May 9-11. Dr. B. B. Souster, 496 Lowry Medical Arts Bldg., St. Paul 2, Secretary.

Mississippi State Medical Association, Biloxi, May 10-12. Dr. T. M. Dye, Box 295, Clarksdale, Secretary.

New Hampshire Medical Society, Newcastle, Hotel Wentworth, June 14-15. Dr. Carleton R. Metcalf, 5 S. State St., Concord, Secretary.

North Carolina Medical Society of the State of Pinehurst, The Carolina, May 9-11. Dr. Roscoe D. McMillan, P. O. Box 232, Red Springs, Secretary.

North Dakota State Medical Association, Minot, May 14-17. Dr. O. A. Sedlak, 702 First Ave. S., Fargo, Secretary.

Oklahoma State Medical Association, Tulsa, Mayo Hotel, May 15-19. Mr. R. H. Graham, 210 Plaza Court Bldg., Oklahoma City, Secretary.

Rhode Island Medical Society, Providence, May 11-12. Dr. Morgan Cutts, 106 Francis St., Providence 3, Secretary.

Society for Investigative Dermatology, Atlantic City, Ritz Carlton Hotel, June 11-12. Dr. S. William Becker, 55 E. Washington St., Chicago 2, Secretary.

Society of American Bacteriologists, Cincinnati, May 15-20. Dr. John Blair, Hospital For Joint Diseases, New York, Secretary.

Society of Biological Psychiatry, Atlantic City, Chalfonte-Haddon Hall, June 12. Dr. George N. Thompson, 1136 W. Sixth St., Los Angeles, Secretary.

South Carolina Medical Association, Myrtle Beach, May 17-19. Dr. Julian P. Price, 15 W. Cheves St., Florence, Secretary.

South Dakota State Medical Association, Yankton, May 22-24. Dr. Roland G. Mayer, 22½ S. Main St., Aberdeen, Secretary.

Southeastern Surgical Congress, Biloxi, Miss., May 23-26. Dr. Benjamin T. Beasley, 45 Edgewood Ave. S.E., Atlanta 3, Ga., Secretary.

Western Branch of American Public Health Association, Los Angeles, Hotel Biltmore, May 30-June 1. Mr. Walter S. Mangold, University of California, Berkeley, Calif., Secretary.

Medical News

(Physicians will confer a favor by sending for this department items of news of general interest: such as relate to society activities, new hospitals, education and public health. Programs should be received at least two weeks before the date of meeting.)

ALABAMA

Organize Post Graduate Assembly.—The Black Belt Post Graduate Assembly was organized recently at Marion by members of eleven Black Belt county medical societies. Its purpose is to present refresher courses on recent scientific discoveries and to bring doctors together for round table discussions. Dr. Arthur F. Wilkerson, Marion, is president. The first assembly will be held in Marion May 12.

COLORADO

Postgraduate Courses.—A postgraduate course in diseases of the chest sponsored by the Trudeau society will be held at the University of Colorado Medical Center, Denver, July 18-30. Admission to this course is open to all physicians interested in chest diseases. The tuition will be \$100 for the two weeks; attendance will be limited to forty. Applicants should write directly to the American Trudeau Society, 1790 Broadway, New York. Applications for scholarships may be made through the Colorado Tuberculosis Association, Denver.

A postgraduate course in obstetrics and gynecology will be held at the University of Colorado Medical Center, May 20-21, under the sponsorship of the department of obstetrics and gynecology of the University School of Medicine. It is open to all general practitioners and specialists who are graduates of approved medical schools and are members of their constituent medical societies. The guest lecturer will be Dr. Charles E. McLennan, Stanford University School of Medicine, Stanford University-San Francisco, whose subject will be "Use of Hormones in Obstetrics and Gynecology." For information address the Director of Graduate and Postgraduate Medical Education, University of Colorado Medical Center, Denver.

CONNECTICUT

Cancer Detection Centers.—The Medical Advisory Committee of the Connecticut Cancer Society is reviewing the experience of its three centers in Hartford, New Haven and Bridgeport, which have been in operation from one to two years. Public interest has exceeded the capacity of the centers, and a large backlog of persons waiting for appointment has developed at the New Haven and Bridgeport centers. The delay is a primary concern to the society, whose aim is to promote prompt diagnosis. The committee appointed includes Drs. Alfred L. Burgdorf, chairman; Allan J. Ryan, Meriden, chairman of the Committee on Tumor Study of the Connecticut State Medical Society, and Francis A. Sutherland, Torrington, chairman of the Connecticut Association of the Tumor Clinics. The committee believes that some way must be found to increase the use of doctors' offices as detection centers through cooperation between physicians and the society.

GEORGIA

Personal.—Dr. Cornille J. Heymans, professor of pharmacology of the University of Ghent, Belgium, has been appointed visiting professor of pharmacology at Emory University School of Medicine, Atlanta, during the spring quarter.

Atlanta Radiological Society.—At a meeting March 11 an Atlanta Radiological Society was organized with Dr. James J. Clark, president, and Dr. William W. Bryan, secretary and treasurer. The society will hold monthly meetings except during the summer.

Course in Office Endocrinology.—The University of Georgia School of Medicine, Augusta, announces a graduate course in office endocrinology to be given May 23-28. The course is offered as a refresher and guide in those aspects of basic endocrinology which have practical and clinical application. The lectures will deal with the endocrine problems which arise in everyday practice. Registration is limited to fifty. Enrollment is open to all qualified physicians. Applications should be addressed to the Registrar, University of Georgia School of Medicine, Augusta.

ILLINOIS

Annual State Meeting.—The annual meeting of the Illinois State Medical Society will be held at the Palmer House, Chicago, May 16-18, under the presidency of Dr. Percy E. Hopkins, Chicago. Out of state speakers on the general scientific program include:

- Edward L. Turner, Seattle, A Dean Looks at Medical Education and Practice.
- J. Arnold Bergen, Rochester, Minn., Amebiasis (Amoebic Colitis): Its Present Day Management.
- Nathan C. Foot, New York, Limitations and Pitfalls of Cytologic Diagnosis.
- Joseph Hardy, St. Louis, Functional Uterine Bleeding.
- William A. Sodeman, New Orleans, How Does Malaria Interest the Practitioner in Illinois?
- Robert Elman, St. Louis, Intestinal Obstruction in Infancy.
- Wendell G. Scott, St. Louis, The Importance of Diagnosing Early Carcinoma of the Colon.
- Ralph O. Rychener, Memphis, Tenn., Retrorenal Fibroplasia.
- Harris B. Shumacker Jr., Indianapolis, Treatment of Peripheral Vascular Disorders.
- Nathaniel G. Alcock, Iowa City, Tumors of the Kidney.

At the annual dinner Monday at 7 p. m. Mr. William A. Richardson, editor of *Medical Economics*, who has just returned from a two months' stay in England, will speak on "Britain's Medical Experiment: One Year Later." Section meetings will be held. The Woman's Auxiliary to the association will hold its program at the LaSalle Hotel May 16-17. Other special societies and alumni groups have scheduled meetings or luncheons.

Chicago

Influenza Research.—The U. S. Public Health Service has awarded a grant of \$5,500 to the University of Illinois College of Medicine for a second year of study on the physiologic effects of the influenza virus on the host, under the supervision of Dr. John E. Kempf in the department of bacteriology.

Grants for Research.—Six grants totaling \$22,825 have been awarded to the University of Illinois College of Medicine for research studies. The Pope Foundation, Inc., has made a \$10,000 grant for research in neuromuscular skeletal pathology. Bristol Laboratories, Inc., Syracuse, N. Y., has renewed a \$7,000 grant for research on pharmacology of synthetic penicillin derivatives and analgesic drugs. The National Institutes of Health are supporting a study of the role of amino acid metabolism in leukemia with a grant of \$4,200. Other grants have been received from the American Medical Association, \$625 for the study of the effect of beta radiation from radium D on the eye; the G. D. Searle Company, \$600 for a preliminary study of the antacid compounds, and Abbott Laboratories, \$400 for experimental study of the effect of penicillin and streptomycin in peritonitis; \$4,000 from the Mallinckrodt Chemical Works, St. Louis, for a pharmacologic study of alkyl carbonates; \$3,600 from the Josiah Macy Jr. Foundation for the continuance of study of carbohydrate metabolism in mental diseases, and \$3,500 from Swift and Company for a study of the assimilation and excretion of amino acids as related to nutrition.

IOWA

Organize School Health Program.—In cooperation with school authorities, physicians of the Waterloo Medical Society have inaugurated a system of their own for school health. Examinations in high schools were begun last year to insure safety in gymnasium and swimming activities. The physicians have decided that children will be examined in kindergarten and every four years thereafter until they graduate from high school. The doctors are assigned by lot to various schools, and the Board of Education decides on a nominal fee for the medical society after conferring with the doctors. Many physicians work at the schools on Thursday afternoons, their traditional holiday. Dr. Charles A. Waterbury Jr. is medical chairman of the program.

KANSAS

Residencies in Neurology.—Three appointments to residencies in neurology are available at Veterans Administration Hospital, Topeka, which has been accredited for two years of residency training in neurology. The program provides for clinical and didactic instruction, including laboratory training in neuroanatomy, electroencephalography and neuropathology. The number of neurologic admissions per year is approximately 400, and the average number of neurologic patients on the service is 75. Residents in neurology have the opportunity for clinical assignments in neurosurgery and psychiatry. Applications should be sent to the Director of Professional Education, Veterans Administration Hospital, Topeka.

LOUISIANA

Annual State Medical Meeting.—The annual meeting of the Louisiana State Medical Society was held at the Roosevelt Hotel, New Orleans, May 5-7. Out of state speakers included:

- Merrill W. Everhart, San Angelo, Texas, Abdominal Emergencies in Infancy and Childhood.
 - Martin H. Fischer, Cincinnati, Blood Vessel Disease.
 - Arthur B. Hunt, Rochester, Minn., Difficult Labor in Relation to Forceps Delivery.
 - Mr. Robert F. Hurligh, Chicago, Fallacies of Socialism.
 - Robert Lich Jr., Louisville, Ky., Retropubic Prostatectomy.
 - E. Sterling Nichol, Miami, Fla., Clinical Use of Heparin and Dicumarol.
 - Oran V. Prejean, Dallas, Texas, Conservative Management of Cervicitis.
- Scientific and technical exhibits were on display.

MAINE

Society of Anesthesiologists.—The Maine Society of Anesthesiologists was formed recently when physicians interested met at Veterans Administration Facility at Togus. Officers elected were Drs. Gilbert Clapperton, Lewiston, president, and John R. Lincoln, Portland, secretary-treasurer. The purpose of the society is to advance the science and art of anesthesiology and to stimulate interest in the specialty.

MICHIGAN

Dr. Buggs Goes to Dillard University.—Charles W. Buggs, Ph.D., associate professor of bacteriology at the Wayne University College of Medicine, Detroit, has left to become chairman of the Division of the Sciences and professor of biology at Dillard University in New Orleans. He will also serve as consultant in premedical education to a group of Negro institutions of higher learning in connection with a long range project supported by a Rockefeller Foundation grant. Dr. Buggs taught at Dillard for eight years before coming to Wayne University in 1943.

Hillsdale Plan for Tumor Detection.—The Cancer Control Committee of the Michigan State Medical Society reports that during the first year of operation the Hillsdale Plan for Tumor Detection discovered 35 cases of cancer among 1,077 persons who were examined by physicians of that county in their offices during regular office hours. Cancer was found in 3.25 per cent of those examined, in contrast to 0.8 per cent reported by the American Cancer Society in a nationwide survey of 125 cancer detection centers. The Hillsdale Plan makes every physician's office a cancer detection unit, conserves the physician's time and eliminates cost of equipment and maintenance of special detection centers. The plan can be adopted by any medical society, it is reported, with such changes as are necessary to meet local conditions.

NEW YORK

Postgraduate Lectures.—The Medical Society of the State of New York with the cooperation of the New York State Department of Health has arranged a postgraduate lecture for the Jefferson County Medical Society to be given May 17 at 8:30 p. m. at the Black River Valley Club, Watertown. Dr. Henry C. Shaw, Rochester, will speak on "Common Diseases of the Skin."

Regional Cancer Teaching Day.—Members of the county medical societies of Broome, Chemung, Chenango, Cortland, Delaware, Otsego, Schuyler, Tioga and Tompkins counties are invited to a Cancer Teaching Day program May 25 at the City Hospital, Binghamton, beginning at 2:30 p. m. and extending into the evening. Following the motion picture, "Cancer: The Problem of Early Diagnosis," the speakers will be:

- Henry D. Diamond, New York, Significance of Enlarged Lymph Nodes.
- Harold A. Solomon, D.D.S., Buffalo, Clinical and Radiographic Diagnosis of Oral Tumors.
- William A. Cooper, New York, Gastric Cancer—Newer Diagnostic Methods.
- Clyde L. Randall, Buffalo, Abnormal Vaginal Bleeding.

The program has been arranged by the state, county and city medical societies in cooperation with the state health department.

New York City

Eighth Harvey Lecture.—Sam Granick, Ph.D., associate, The Rockefeller Institute for Medical Research, will deliver the eighth Harvey Lecture of the current series at the New York Academy of Medicine May 19 on "Heme and Chlorophyll."

Personals.—Dr. Arthur A. Knapp recently returned from Cuba where, at the invitation of the Cuban Ophthalmological Society, he lectured on "Surgery of the Eye" and "Shrinking the Human Eye—Therapeutically."—Dr. Edward P. Eglee has

been elected chairman of the executive committee of the New York Tuberculosis and Health Association, Inc., succeeding Dr. Donald B. Armstrong. Myron I. Borg Jr. was reelected secretary.—Dr. Walsh McDermott, associate professor of medicine, Cornell University Medical College, was named honorary professor of clinical medicine by the University of Guadalajara, Mexico, February 8, in recognition of his part in the investigation there last summer on the use of aureomycin, chloromycetin® and polymyxin in the treatment of typhoid, typhus and brucellosis.—Dr. George T. Pack has accepted an invitation to deliver a series of lectures and tumor conferences sponsored by the Cancer Society of Hawaii and the Hawaii Territorial Medical Association during the early part of May. He will stay in Hawaii about three weeks.

OREGON

Personal.—Dr. Samuel B. Osgood, former head of the Josephine County health unit, has been appointed director of the venereal disease section of the Oregon State Board of Health.

Postgraduate Convention in Ophthalmology and Otolaryngology.—The Oregon Academy of Ophthalmology and Otolaryngology will hold its annual spring postgraduate convention in Portland June 19-24. Round table luncheon discussions will be held each noon at the medical school cafeteria. Guest speakers will be: Drs. Lawrence R. Boies, Minneapolis; Leland G. Hunnicutt, Pasadena, Calif.; James H. Allen, Iowa City, and Edmund B. Spaeth, Philadelphia. Arrangements for hotel accommodations should be made through Dr. David D. DeWeese, secretary, 1216 S. W. Yamhill Street, Portland 5. The fee of \$75 includes the cost of daily luncheons and a printed abstract of the lectures given by guest speakers.

VERMONT

Appointment at University.—Dr. John F. Daly, New York, has been appointed assistant professor of dermatology at the College of Medicine at the University of Vermont and State Agricultural College, Burlington, effective April 4. Dr. Daly, a graduate of Long Island College of Medicine, Brooklyn, 1937, was in private practice in Oklahoma until entering the Army Medical Corps in 1940. Since his discharge in 1946 he has done graduate work in dermatology at Columbia University. He is a specialist certified by the American Board of Dermatology and Syphilology.

WEST VIRGINIA

Plan to Relieve Doctor Shortages.—The Public Health Council, which will go out of existence June 30, has scheduled what may be its last meeting before the new law providing for a medical licensing board becomes effective. The meeting will be held May 12 to consider the report of a special committee on the proposed plan for the temporary employment of interns and residents to help relieve the acute shortage of doctors in parts of the state.

Conference on Medical Care.—A statewide conference on medical care will be held at Jackson's Mill May 21 beginning at 10 a. m., under the sponsorship of the Public Relations Committee of the West Virginia State Medical Association. The object of the conference is to seek a solution to the problems of medical care in rural, industrial and small town areas. Dr. Frank J. Holroyd, Princeton, chairman of the committee, is trying to reach all consumer groups so that medical care for such groups in every area of the state may be considered. The doctor shortage in the state is showing no improvement.

WISCONSIN

Dr. MacKay Succeeds Dr. Waters.—Dr. Alexander M. MacKay has been named subchairman of the department of anesthesiology at the University of Wisconsin Medical School, Madison, succeeding Dr. Ralph Waters, who retired in January (THE JOURNAL, February 5, p. 391). Dr. MacKay came to the University in July 1948. He is a native of Nova Scotia and received an M.D. degree from Dalhousie University Faculty of Medicine, Halifax, Nova Scotia. During World War II he served with the Seventh Canadian General Hospital in England, and on the continent. From July 1945 to July 1948 he worked at Radcliffe Infirmary, Oxford University, England. He holds the diploma in anesthetics of the Royal College of Physicians and Surgeons of England and has been certified as a specialist in anesthetics by the Royal College of Surgeons, Canada.

GENERAL

Vice Presidents' Breakfast.—The past vice presidents' breakfast will be held at the Brighton Hotel, Garden Room, Atlantic City, June 7, 8 a. m.

Society Changes Name.—The American Society for Research in Psychosomatic Problems, Inc., has changed its name to the American Psychosomatic Society.

Academy of Neurology Meeting.—The first annual meeting of the American Academy of Neurology will be held in French Lick Springs, Ind., June 1-3. Dr. Abe B. Baker, Minneapolis, is president of the newly formed organization (THE JOURNAL, April 30, p. 1288).

Health Educators Conference.—The Middle States Region Health Educators Conference will be held in Milwaukee May 11-13, with headquarters at the Hotel Pfister. Discussions will be held on the following subjects: The Health Educator in the School, The Health Educator in the Community, The Health Educator Around the Clock, and The Health Educator Uses Tools.

Bacteriologists' Annual Meeting.—The Society of American Bacteriologists will hold its general meeting in Cincinnati, May 17-20 with headquarters at the Netherland Plaza. The program includes numerous presentations on antibiotics, tuberculosis, immunology, and influenza. Any person interested in bacteriology is invited to attend. The registration fee is \$2 except for nonmembers, for whom it is \$3.

Meeting of Pathologists.—The College of American Pathologists, the Ohio State Society of Pathologists and the Cleveland Society will hold a North Central Regional meeting May 27-28 at the Institute of Pathology, Western Reserve University, Cleveland. A dinner in honor of Dr. Howard T. Karsner will be held 7-9 p. m. on Friday. Dr. Karsner is leaving Western Reserve University to assume duties as consultant to the Surgeon General of the Navy on medical research. Colonel James E. Ash, Washington, D. C., of the Army Institute of Pathology, will serve as toastmaster.

Rehabilitation Conferences.—The National Rehabilitation Association will hold a regional conference May 16-18 in Toledo with headquarters at the Commodore Perry. Working harmony among management, labor, the client and the counselor is the subject for the opening session. The afternoon and evening programs will be devoted to a discussion of rehabilitating and placing the blind. Tuesday's program includes plastic surgery, speech therapy, physical medicine, crippled children's camps and Alcoholics Anonymous in relation to vocational rehabilitation. The banquet speaker Tuesday night will be Dr. Charles F. Shook, medical director, Owens-Illinois Glass Company, Toledo.

The Western States Conference of the National Rehabilitation Association will be held June 1-2 at the Benjamin Franklin Hotel, Seattle. Rehabilitation developments in occupational, physical and manual arts therapy, vocational counseling, social work and physical medicine will be discussed. Panels will be led by national and regional authorities on rehabilitation. Reservations should be made by writing Mr. Max S. Smith, Textile Tower, Room 910, Seattle.

Meeting of Otolological Society.—The American Otolological Society, Inc., will hold its annual meeting at the Hotel Biltmore, New York, May 18-19, under the presidency of Dr. Marvin F. Jones, New York. Those presenting papers by invitation include:

Hallowell Davis, St. Louis, Sound and Ultra Sound as Hazards to Hearing.

Frank D. Lathrop, Boston, Surgery of Ménière's Syndrome: Evaluation of Neurosurgical and Otolological Procedures.

Thursday afternoon's program includes a Symposium on the Various Methods Used to Prevent or Improve Hearing Impairment in Children. The address of the guest of honor, Dr. Harris P. Mosher, Marblehead, Mass., will be given at the opening session. The annual dinner will be Wednesday evening.

National Foundation Allocates \$2,500,000.—At the most recent meeting of the National Foundation for Infantile Paralysis board of trustees, \$2,565,159 was allocated for research on poliomyelitis and educational projects. This brings to \$23,600,000 the total amount authorized for education and research by the national foundation since it was established in 1938. Twenty-four of the projects will provide for research, and the remaining seventeen will underwrite educational programs. The University of Southern California, University of Kansas, University of Utah and the University of Pittsburgh are engaged in related investigations to determine the number and characteristics of various poliomyelitis viruses. In the field of education fellowships are being awarded in

orthopedic surgery, virology, pediatrics, epidemiology, and clinical neurology. Orthopedic nursing courses and expanded professional teaching programs are also being provided.

Conference on Industrial Ophthalmology.—The department of ophthalmology, University of Pittsburgh School of Medicine, and the Industrial Hygiene Foundation at Mellon Institute are sponsoring a Conference on Industrial Ophthalmology at the institute May 16-18. Speakers include:

John A. Hutcheson, Ph.D., Pittsburgh, Application of Electromagnets in Ophthalmology.

Raymond J. Gray, Pittsburgh, Treatment of Intraocular Foreign Bodies.

E. C. Barnes, East Pittsburgh, Eye Irritants Occurring in Industrial Atmospheres.

Dudley A. Irwin, Pittsburgh, Ophthalmological Problems Facing the Medical Director.

Jay G. Linn Jr., Pittsburgh, Ocular Symptoms of Head Injuries.

Robert F. Rohm, Pittsburgh, Lacerations of Eye Ball; Preparation of Patient for Transfer to Ophthalmologist or Hospital.

F. Bruce Fralick, Ann Arbor, Mich., Care of Orbital Injuries.

Hedwig S. Kuhn, Eyes for Industry.

John C. Dunbar, Pittsburgh, Pathology of Eye Trauma.

Ralph S. McLaughlin, Charleston, W. Va., Treatment of Chemical Burns of the Eye.

Samuel M. Dupertuis, Pittsburgh, Reconstruction of Deformities of the Eye Lids.

Grants by Research Corporation.—Sixty-five grants totaling nearly \$250,000 to aid scientific research in colleges, universities and institutes were announced last month by Research Corporation. New grants bring to a total of nearly \$1,500,000 the Corporation grants now in force. In general they are assigned to men in smaller colleges and institutes that need help in supporting research programs. Projects include research in medicine, nuclear physics, chemical engineering and general human welfare. Research Corporation was founded in 1912 by the late Frederick G. Cottrell, Ph.D., who assigned to it patents on his process for cleansing industrial gases by electrical precipitation. Other income is derived from the management of patents assigned to it by individuals and institutions. The Williams-Waterman Fund, administered by the corporation, derives its income from patents on the synthesis of vitamin B₁₂ and its grants go chiefly to aid research into dietary deficiency diseases. Research Corporation is completely non-profit and distributes its total net income in grants to aid research. It maintains offices in New York, Chicago and Los Angeles.

CORRECTION

Dosage of Streptomycin in Tuberculous Meningitis: Inquiries have been received concerning the dosage of streptomycin in the treatment of tuberculous meningitis discussed by the authors on pages 756 and 757 of the paper entitled "Specific Therapy of Bacterial Infections of Central Nervous System" in THE JOURNAL of March 19. These inquiries were referred to the authors, who make the following explanation: "Because of the toxicity of streptomycin when it is used over a long period of time, it was felt that a small dose on the order of 9 mg. per kilogram per day should be used, but if it was felt necessary—due to the critical condition of a patient—up to 2 Gm. per day may be used. It might be added that since this paper was written, the appearance of the less toxic antibiotic—dihydrostreptomycin—for clinical use, would allow the dosage schedule to be revised upward."

Marriages

LEE BUCKINGHAM BROWN, Norfolk, Va., to Miss Kathryn Jackson Fahys of Garden City, N. Y., in New York, in March.

GUY OTIS KELLER JR., Rochester, N. Y., to Miss Beverly Ruth Splitt of Pittsford, N. Y., March 26.

EDWARD KINZEL RUSSELL, Abingdon, Va., to Miss Ann Katherine Ransom in Atlanta, March 26.

NATHAN G. HALE to Miss Dorothy Neelley, both of Sacramento, Calif., in New York, January 1.

WILLIAM BANTA ATEN to Mrs. Kathryn Johns Hinckley, both of Binghamton, N. Y., March 8.

MAURICE M. MALTINSKY to Miss Ruth Lee Cohn, both of Rochester, N. Y., March 6.

CHARLES BROWN VAN GORDER, Lombard, Ill., to Miss Elaine Carol Atkinson of Melrose Park, February 26.

HELEN CAROLYN AMMON, Detroit, to Mr. Edward Moore of Chicago, December 4.

LAWRENCE S. MORSE to Miss Joan Pinanski, both of Brookline, Mass., April 3.

Deaths

William James Carson ☉ Milwaukee; born in Harmerville, Pa., in 1892; Maryland Medical College, Baltimore, 1913; member of the founders group of the American Board of Surgery; fellow of the International College of Surgeons and the American College of Surgeons; member of the Western Surgical Association, American Association for the Study of Trauma and the American Urological Association; formerly associate professor of pathology at the University of Maryland School of Medicine in Baltimore and on the faculty of Marquette University School of Medicine; served during World War I; on the staffs of Johnston Emergency and West Side hospitals; formerly surgeon to St. Luke's Hospital; consulting surgeon to St. Alphonsus Hospital in Port Washington; killed in an automobile accident near Delafield February 12, aged 56.

William Albert Plummer ☉ Rochester, Minn.; born in Racine, Minn., June 30, 1883; Northwestern University Medical School, Chicago, 1910; entered the Mayo Clinic as assistant in medicine in June 1910, and became head of a section in medicine Feb. 1, 1917; later became associate professor of medicine in the Mayo Foundation and senior consultant in a division of medicine of the Mayo Clinic; specialist certified by the American Board of Internal Medicine; member of the Minnesota Society of Internal Medicine, Central Society for Clinical Research, American Association for the Study of Goiter and the Association for the Study of Internal Secretions; fellow of the American College of Physicians; died March 22, aged 65, of heart block and chronic rheumatic endocarditis.

Henry Woodruff Titus ☉ New Rochelle, N. Y.; born in Auburn, N. Y., March 6, 1876; Columbia University College of Physicians and Surgeons, New York, 1902; specialist certified by the American Board of Pediatrics; fellow of the American Academy of Pediatrics and the New York Academy of Medicine; past president of the Westchester County Medical Society; served overseas during World War I; for many years a member of the governing board of the New Rochelle Public Library and at one time its president; formerly director of the pediatric service at Grasslands Hospital in Valhalla; director of pediatrics, served on the board and in various capacities on the staff at New Rochelle Hospital, where he died March 17, aged 73, of multiple myeloma and chronic nephritis.

Herbert Ashley Durfee ☉ Burlington, Vt.; born in Poultney, Vt., Aug. 14, 1897; University of Vermont College of Medicine, Burlington, 1920; professor of obstetrics at his alma mater; specialist certified by the American Board of Obstetrics and Gynecology, Inc.; member of the New England Obstetrical and Gynecological Society and New England Surgical Society; fellow of the American College of Surgeons; affiliated with Fanny Allen Hospital in Winooski, Mary Fletcher Hospital and the Bishop de Goesbriand Hospital; died February 24, aged 51, of carcinoma.

Elbert William Wright, Bowie, Texas; Fort Worth School of Medicine, Medical Department of Fort Worth University, 1910; member of the American Medical Association; in 1944 vice president of the State Medical Association of Texas; past president of the Clay-Montague-Wise Counties Medical Society and the Thirteenth District Medical Society; for many years a member and at one time chairman of the state board of health; served during World War I; affiliated with the Bowie Clinic and Hospital; died January 3, aged 61, of coronary thrombosis.

Edwin Study Africa ☉ Warren, Pa.; Hahnemann Medical College and Hospital of Philadelphia, 1907; died in Warren General Hospital December 30, aged 69, of carcinoma of the urinary bladder.

George Albert Canfield, Cincinnati; University of Michigan Medical School, Ann Arbor, 1946; certified by the National Board of Medical Examiners; affiliated with Christ Hospital, where he died January 26, aged 25, of virus B encephalomyelitis.

Joseph Light Daugherty, Mechanicsburg, Pa.; Medico-Chirurgical College of Philadelphia, 1910; member of the American Medical Association; died December 31, aged 64, of coronary occlusion and general arteriosclerosis.

Benjamin Davis ☉ Cushing, Okla.; St. Louis University School of Medicine, 1906; died January 20, aged 69, of heart and kidney complications following neurodermatitis.

Reuben J. Dice, Randlett, Okla.; Fort Worth School of Medicine, Medical Department of Fort Worth University, 1904; died December 16, aged 84.

Frank S. Hundley, Baltimore; University of Maryland School of Medicine, Baltimore, 1916; served during World War II; died January 25, aged 57, of gastric hemorrhage and esophageal varices.

Charles Grant Johns, Chicago; Jenner Medical College, Chicago, 1910; died in Cook County Hospital December 30, aged 69, of bronchopneumonia.

John Keely, Jacksonville, Fla.; Jefferson Medical College of Philadelphia, 1901; died January 23, aged 73, of coronary thrombosis.

Merton Ray Kittredge, Bryan, Ohio; Ohio State University College of Medicine, Columbus, 1916; on the staff of the Cameron Hospital; died in the State Hospital, Toledo, January 5, aged 62, of cerebral arteriosclerosis.

Bertha C. Lietze, Cincinnati; Laura Memorial Woman's Medical College, Cincinnati, 1897; died in the Hamilton County Home and Chronic Disease Hospital January 15, aged 75, of cerebral arteriosclerosis.

Thomas Clifton McCurdy, Denison, Texas; University of Texas School of Medicine, Galveston, 1903; served during World War I; during World War II medical examiner for Selective Service in Archer County; formerly practiced in Archer City, where he was city and county health officer; died in Waco, December 16, aged 71, of cerebral accident.

Horace MacField McDaniel, Stephenville, Texas; Fort Worth School of Medicine, Medical Department of Fort Worth University, 1905; member of the American Medical Association; past president of the Brown-Comanche-Mills-San Saba Counties Medical Society; for many years member of the school board in May; formerly superintendent of the Austin State School Farm Colony; died January 2, aged 67, of multiple myeloma.

Frank Washington Milburn, Spokane, Wash.; George Washington University School of Medicine, Washington, D. C., 1912; also a graduate in pharmacy; member of the American Medical Association; on the staffs of the Sacred Heart, St. Luke's and Deaconess hospitals; died January 30, aged 61, of acute heart disease.

Carl Mund, Manorville, N. Y.; College of Physicians and Surgeons, medical department of Columbia College, New York, 1892; died in Southampton, January 19, aged 81, of hemiplegia, hypertension and arteriosclerosis.

James Robert Norton ☉ Port St. Joe, Fla.; University of Arkansas School of Medicine, Little Rock, 1936; member of the American Association of Industrial Physicians and Surgeons; served as secretary-treasurer of the Franklin-Gulf Counties Medical Society; died December 29, aged 43, of coronary occlusion.

Elmer Onstott ☉ Saltsburg, Pa.; College of Physicians and Surgeons of Chicago, 1889; an Associate Fellow of the American Medical Association; died December 2, aged 87, of hypostatic pneumonia and arteriosclerosis.

Isaac Swartz Plymire ☉ Petersburg, Pa.; Jefferson Medical College of Philadelphia, 1903; died in the J. C. Blair Memorial Hospital, Huntingdon, December 8, aged 80, of arteriosclerosis.

Oscar William Renz, Erie, Pa.; College of Physicians and Surgeons, Baltimore, 1915; member of the American Medical Association; affiliated with St. Vincent's and Hamot hospitals; died February 3, aged 56, of hypertensive cardiovascular disease.

Griff Ross ☉ Mount Enterprise, Texas; Baylor University College of Medicine, Dallas, 1915; died December 15, aged 67, of nephritis.

Herman Spitz ☉ Nashville, Tenn.; Vanderbilt University School of Medicine, Nashville, 1912; specialist certified by the American Board of Pathology; member of the American College of Allergists and the American Society of Clinical Pathologists; city bacteriologist; died in the Vanderbilt Hospital February 4, aged 63, of cardiovascular disease.

Joseph Eber Stover, Truscott, Texas; University of Nashville (Tenn.) Medical Department, 1900; member of the American Medical Association; died in Quanah, December 29, aged 71, of coronary occlusion.

Fitch Henry Van Orsdale, Auburn, N. Y.; University of Buffalo School of Medicine, 1891; member of the American Medical Association; died January 29, aged 89, of uremia.

Edwin Merritt Wilson, Twin Bridges, Mont.; Omaha Medical College, 1895; died January 3, aged 79.

Foreign Letters

PARIS

(From Our Regular Correspondent)

March 17, 1949.

New Professors

The first professorship of rheumatology in Europe has been created at the Paris Faculty of Medicine and entrusted to Professor F. Coste, well known in France and abroad on account of his works on this matter. Another new professorship, on infantile neuropsychiatry, has been entrusted to Professor G. Heuyer, whose authority is universally acknowledged.

M. Desoille has been appointed professor of industrial medicine; M. Gaillard professor of parasitology; Professor *agregé* Merle D'Aubigne professor of surgical orthopedic clinics, and Professor *agregé* de Gaudart D'Allaines professor of surgical pathology at the same faculty.

Coming Meetings

The Twenty-Fifth Congress of Forensic Medicine, Social Medicine and Industrial Medicine of the French Language will take place in Bordeaux May 11-15. On the agenda, among other items are biologic and clinical study of pregnancy in forensic medicine; the metabolism of solvents in industrial medicine, and medicolegal psychiatry. The general secretary is Professor Muller, Institut Medico-Legal, Boulevard Paul-Painlevé, Lille.

The Thirteenth French Congress of Gynecology will take place June 7-11 in Biarritz. On the agenda are dyspareunia and anaphrodisia in women. The general secretary is M. Fabre, 1, Rue Jules Lefebvre, Paris 9.

The general meeting of the International League Against Trachoma will take place in Paris at the end of May. On the agenda is "Scheme of Unification of World Legislation Against Trachoma" (C. Montincho, Lisbon). Apply to: J. Sedan, 94 Rue Sylvabelle, Marseilles.

ITALY

(From Our Regular Correspondent)

NAPLES, March 7, 1949.

Herniated Disk and Sciatica

Until now there had not been in Italy an exhaustive work on herniated disk which could have been looked on as authoritative. Consequently the ample study carried out by Prof. Francesco Delitala and Prof. A. Bonola which has just been published may assume great value. Delitala, a major Italian orthopedist, occupies the chair of orthopedics at the University of Bologna, being the director of the Rizzoli Orthopedic Institute, the preceding director of which was the late Prof. Vittorio Putti.

In the United States there was enthusiasm at first in favor of surgical intervention in cases of herniated disk, but we have witnessed a warm invitation to caution.

On the contrary, according to Professor Delitala, the treatment of the herniated intravertebral disk can be surgical only. All the other methods of treatment provide for only temporary relief. The longer intervention is delayed the more the consequences are aggravated because of the pressure exerted by the hernia on the nerve roots. The use of plaster of paris casts for immobilization of the vertebral column makes things worse; in fact it hastens the paralytic phase. Professor Delitala

does not exclude a spontaneous cure, but in the presence of hernia with its characteristic acute subjective and objective symptoms early operation is imperative.

At the Rizzoli Orthopedic Institute the clinical histories of 7,000 cases of arthritis and sciatica have been reviewed. From 1934 to 1948 Delitala operated on 217 patients, and 170 of them were followed up for many years. The results were excellent in 34.1 per cent of the cases, with regard to the disappearance of pain, capacity for work being restored to normal; there were no recurrences. Results were satisfactory in 31.7 per cent of the cases, with disappearance of the painful symptoms and with normal working capacity, but for two to three years there persisted some deficiency of the reflexes and sensibility (absence of the achilles tendon reflex, of the medium plantar reflex); there were small hypesthetic areas, sometimes Lasègue's sign. Results were fair in 25.2 per cent of the cases: the pain subsided, but reappeared promptly with slight attacks of cough or on pressure of the jugular veins; while the subjective symptoms were attenuated, one could still observe signs of sensorimotor paresis; the patients could do even hard work. Results were mediocre in 7.6 per cent of the cases, with headache, insomnia, excessive fatigue, and coccygia months after the operation. One and one-tenth per cent of the patients were not helped; pain had not disappeared but was associated with sexual impotence as a sequela of the intervention. From this analysis, the author concludes that the intervention warrants utmost optimism and that surgeons should not hesitate to operate on patients with manifest hernia of the disk. Only postponement may aggravate the prognosis with regard to post-operative recovery.

Mechanism of Herniated Disk.—Delitala and his co-worker, Professor Bonola, studied the mechanism by which protrusion of the herniated disk may be determined experimentally under pressure. The nucleus pulposus, as is known, is not situated in the center of the fibrous ring of the intervertebral disk, but is somewhat eccentric in the posterior space, and that applies particularly to the lumbar section of the vertebral column. At the same time, the portion of the fibrous ring which is situated in front of the pulposus is far more dense and consistent than the portion of the fibrous ring which is situated behind in the posterior space. And that is the reason, according to Delitala, for the high incidence of herniated disk in the lumbar section, where these anatomic conditions are accentuated. The nucleus pulposus may suffer deformation, but cannot be compressed because of its rich content of fluid. One may consider a small cushion of water, a liquid medium adapting itself passively to the pressure of the fibrosis which conversely is elastic because of its fibers. When one passes from the horizontal to the vertical position, the nucleus pulposus is submitted to a pressure of 45 Kg. When one passes from flexion to extension of the spinal column, the nucleus pulposus sustains a pressure of 90 to 127 Kg. One may imagine the pressure when one lifts heavy objects. Delitala exerted mechanical pressure of 500 Kg. on portions of the vertebral column which had been removed from cadavers, an amount which may come near to that to which the vertebral column is subjected when one lifts a heavy rock. Delitala always observed that the herniated disk protruded according to the mechanism of the incompressible cushion, which breaks the annulus fibrosus.

Surgical Technic.—The technic preferred by Delitala is always the intradural. Occasionally he interposes a cotton pad between the roots and the hernia to avoid trauma of the nerve

roots. His meticulous and gentle technic is that of a great orthopedist, and he employs many instruments designed by Professor Putti for intervention on the spinal cord. Complications such as cerebrospinal fistulas or suppuration did not occur in the 217 patients operated on. Occasionally a mild temporary meningism was observed.

The work of Delitala, carried out in the most famous Italian university institute of orthopedics, will appear in print in one volume.

Correspondence

DENAZIFIED DOCTORS

To the Editor:—Dr. F. Kenneth Albrecht's letter in *THE JOURNAL* of March 26, page 870, necessitates an important correction. Dr. Albrecht regrets that "thousands of competent and qualified German physicians are banned from practicing their profession because they are not yet de-Nazified, having held an honorary rank in the S.S. or S.A. Such rank was mostly commensurate with professional achievement rather than their political views. You might say it corresponded to our American College of Surgeons." This is not a fact. Only on ardent disciples of Nazism was bestowed the "honor" of holding a rank in the S.S., irrespective of professional ability or achievement. Albrecht's statement can only be explained by the fact that he was ignorant of the principles of Nazi hierarchy and that he apparently believed what he was told by the Germans. He seems to be unaware that lying is recognized common practice, not detestable according to the Nazi code if it is believed to further the cause of the German "super race." Many credulous Americans, who did not meet Nazis during the fighting but only after their defeat, size up these people according to standards of normal civilization and ethical principles. They do not realize that Nazis, and especially members of the S.S., whether physicians or not, must not be so considered. These Nazis are victims of the most amazing and dangerous mass psychosis that ever occurred in the history of mankind.

JULIUS BAUER, M.D., Los Angeles 28.

THE NATIONAL PHYSICIANS COMMITTEE

The National Physicians Committee has sent the following letter to all of its contributors and to coordinating organizations.—Ed.

Ten years ago, a group of officers and fellows of the American Medical Association realized that the American Medical Association was not as active in certain functions as was deemed necessary, some of which seemed at that time inappropriate for the American Medical Association to perform. As a result, the National Physicians Committee for the Extension of Medical Service was created and has worked during these intervening years within the policies established by the House of Delegates of the American Medical Association.

Several times during those years, the House of Delegates has expressed confidence in the work of this organization.

Two years ago, a Committee of the House of Delegates reported that "the American Medical Association should and must do its own public relations work."

In December, 1948, the House of Delegates took action to create a new agency to carry on public relations activities and to further the extension of medical care. This new agency has been created and is functioning. The program as planned and now being carried on by the American Medical Association repre-

sents the fulfillment of the objectives for which the National Physicians Committee was created and toward which it has been working.

Its aims having been accomplished, the Board of Trustees of the National Physicians Committee met in Chicago on April 10, 1949 and voted (1) to approve the action of its Management Committee in authorizing cessation of all activities as of April 1, 1949 and (2) to liquidate the affairs of the National Physicians Committee in an orderly manner.

It planned further to hold its next meeting in Atlantic City in June, 1949 and at that time to consider further action looking toward dissolution of the organization.

During its ten years of activity, the National Physicians Committee has brought about the formation of forty-seven state committees of physicians and forty-six state committees of dentists, in addition to other local organizations, that have functioned vigorously and well. The Board of Trustees now suggests to the physicians making up the personnel of these state committees that they offer their services to the new American Medical Association agency.

EDWARD H. CARY, M.D., Chairman
N.P.C. Board of Trustees

ANAPHYLAXIS TO PENICILLIN

To the Editor:—I wish to take exception to a clinical note that appeared in *THE JOURNAL*, February 19, page 526, and that attributes the death of a patient to a (possibly intravenous) injection of penicillin. The author of the note, George L. Waldbott, believes that his patient's death was due to anaphylactic shock caused by the intravenously administered penicillin.

Unfortunately, an autopsy was not performed; moreover, it is to be lamented that the patient's mouth was not opened, because, in my opinion, the case looks much like one of "edema of the glottis" as manifestation of an angioneurotic reaction. In fact, the signs and symptoms described by Waldbott may well be due to edema of the glottis ("tightness" in the nose and throat, cyanosis, itching "all over"—probably first manifestation of a generalized urticaria) and not to anaphylactic shock. Incidentally, this side effect of treatment with penicillin (especially with the older products) is a rather frequent phenomenon, but its occurrence in Waldbott's patient may well be due to her hyposensitizing injection: in fact, I once saw a typical example of it. The distinction between both physiopathologic possibilities that could lead to the patient's death may seem academic hair splitting, but, as a matter of fact, the distinction is of value, for against angioneurotic edema a certain armamentarium is available, although rather inconstant in its effects (Salomon, M. I.: *New York State J. Med.* 47: 12 [June 15] 1947); besides, in extremis, a tracheotomy could be life saving in case of edema of the glottis, but, naturally, of no value in anaphylactic shock.

MARDOQUEO I. SALOMON, M.D., Bronx, N. Y.

NOTE.—The letter was referred to Dr. Waldbott, who replies:

To the Editor:—Angioneurotic edema of the glottis cannot be ruled out. This would be a part of the syndrome of anaphylactic shock. The explanation that this situation was due to the antigenic injection given four hours previously does not seem tenable for the following reasons: 1. Symptoms started within a few seconds after the injection of penicillin. 2. Reactions after an antigenic injection usually occur within two hours (except for those from bacterial antigens). Symptoms arising later would not be severe, certainly not fatal. (See references cited in the paper.) 3. There was blood on the area of the injection, which is suggestive of accidental puncture of a vein.

GEORGE L. WALDBOTT, M.D., Detroit.

Medical Examinations and Licensure

COMING EXAMINATIONS AND MEETINGS

NATIONAL BOARD OF MEDICAL EXAMINERS

NATIONAL BOARD OF MEDICAL EXAMINERS: *Parts I and II*. Various Centers. June 20-22, Sept. 12-14. *Part III*. June, various centers. Exec. Sec., Mr. E. S. Elwood, 225 S. 15th St., Philadelphia 2.

EXAMINING BOARDS IN SPECIALTIES

AMERICAN BOARD OF ANESTHESIOLOGY, INC. *Written*. Various Centers. July 15. *Oral*. Oct. 16-20. Sec., Dr. Curtiss B. Hickcox, 745 Fifth Ave., New York 27.

AMERICAN BOARD OF INTERNAL MEDICINE: *Oral*. Philadelphia, June 1-3. *Written*. Oct. 17. Final date for filing application is May 1. Asst. Sec.-Treas. Dr. W. A. Werrell, 1 Main St., Madison 3, Wis.

AMERICAN BOARD OF NEUROLOGICAL SURGERY: *Oral*. Chicago, June 1949. Sec., Dr. W. J. German, 310 Cedar Street, New Haven, Conn.

AMERICAN BOARD OF OBSTETRICS AND GYNECOLOGY, INC.: *Oral*. Chicago, May 8-14. Sec., Dr. Paul Titus, 1015 Highland Building, Pittsburgh 6.

AMERICAN BOARD OF OPHTHALMOLOGY: *Oral*. New York, June 11-15; St. Louis, Oct. 15-19; Boston, December. Sec., Dr. S. J. Beach, 56 Ivie Rd., Cape Cottage, Maine.

AMERICAN BOARD OF ORTHOPAEDIC SURGERY. *Part I*. Indianapolis, May 6-7 and Denver, May 13-14. *Part II*. New York City, Jan. 1950. Final date for filing application for Part II is Aug. 15. Address: Dr. Francis M. McKeever, 1136 W. 6th St., Los Angeles 14, Calif.

AMERICAN BOARD OF OTOLARYNGOLOGY: New York, May 11-14; Chicago, Oct. 4-7. Sec., Dr. D. M. Lierle, University Hospital, Iowa City.

AMERICAN BOARD OF PEDIATRICS: *Written*. Under local monitors, June 24. *Oral*. Cleveland, Sept. 16-18; New York City, Oct. 21-23; Chicago, Dec. 9-11. Sec., Dr. John McK. Mitchell, 6 Cushman Road, Rosemont, Pa.

AMERICAN BOARD OF PHYSICAL MEDICINE. Philadelphia, June 4-5. Sec., Dr. R. L. Bennett, 30 N. Michigan Blvd., Chicago.

AMERICAN BOARD OF PLASTIC SURGERY: Examinations are given in June and November of each year in the home town of applicants. Sec., Treas., Dr. Louis T. Byars, 400 Metropolitan Bldg., St. Louis, Mo.

AMERICAN BOARD OF PREVENTIVE MEDICINE AND PUBLIC HEALTH: Washington, D. C., May 14-16. Sec.-Treas., Dr. Ernest L. Stebbins, 615 North Wolfe St., Baltimore.

AMERICAN BOARD OF PSYCHIATRY AND NEUROLOGY, INC. *Special Examination*, October. Place to be announced. Final date for filing application is July 15. December. New York City. Sec. Dr. F. J. Braceland, 102-110 Second Ave., S.W., Rochester, Minn.

AMERICAN BOARD OF RADIOLOGY. Atlantic City, June 2-4. Sec., Dr. B. R. Kirklin, 102-110 Second Ave., S.W., Rochester, Minn.

AMERICAN BOARD OF SURGERY: *Written*. Various Centers, October 26. Final date for filing application is July 1. Sec., Dr. J. Stewart Rodman, 225 S. 15th St., Philadelphia.

AMERICAN BOARD OF UROLOGY: *Written*, December. *Oral and Clinical*. Chicago, Feb. 11-15. Final date for receipt of case histories is Sept. 1, 1949. Sec., Dr. Harry Culver, 7935 Sunnyside Road, Minneapolis 18, Minn.

BOARDS OF MEDICAL EXAMINERS

ALABAMA: *Examination*. Montgomery, June 28-30. Sec., Dr. D. G. Gill, 519 Dexter Ave., Montgomery.

ARKANSAS: * Little Rock, June 9-10. Sec., Dr. L. J. Kosminsky, Texarkana. *Eclectic*. Little Rock, June 9-10. Sec., Dr. C. H. Young, 1415 Main St., Little Rock.

CALIFORNIA: *Examination*. San Francisco, June 21-23. Sec., Dr. Frederick N. Scatena, 1020 N St., Sacramento.

COLORADO: * *Examination*. Denver, June 20-22. Sec., Dr. W. W. King, 831 Republic Bldg., Denver.

DELAWARE: Dover, July 12-14. Sec., Dr. J. S. McDaniel, 229 South State St., Dover.

DISTRICT OF COLUMBIA: * *Written*. Washington, May 9-10. Sec., Dr. George C. Ruhland, 4130 Municipal Bldg., Washington.

FLORIDA: * *Examination*. Jacksonville, June 26-28. Sec., Dr. Frank D. Gray, 12 N. Rosalind Ave., Orlando.

GEORGIA: *Examination*. June 8-9, Atlanta and Augusta. *Reciprocity*. Atlanta, June. Sec., Mr. R. C. Coleman, 111 State Capitol, Atlanta.

GUAM: *Endorsement*. Agaña, Last Friday of each month. Sec., Capt. C. K. Youngkin, Dept. of Public Health, Guam. % F.P.O., San Francisco, Calif.

HAWAII: * *Examination*. Honolulu, July 11-14. Sec., Dr. S. E. Doolittle, 881 S. Hotel St., Honolulu.

IDAHO: Boise, July 11-13. Sec., Miss Estella S. Mulliner, Bureau of Occupational Licenses, 355 State House, Boise.

INDIANA: *Examination*. Indianapolis, June 21-23. Sec. Board of Medical Registration and Examination. Dr. Paul R. Tindall, 416 K. of P. Bldg., Indianapolis.

IOWA: * *Examination*. Iowa City, June 13-15. Sec., Dr. M. A. Royal, 506 Fleming Bldg., Des Moines.

KANSAS: Kansas City, June 1-2. Sec., J. F. Hassig, 905 North 7th St., Kansas City, Kans.

KENTUCKY: *Examination*. Louisville, June 15-17. Sec., Dr. Bruce Underwood, 620 S. 3rd St., Louisville 2.

MAINE: Augusta, July 5-6. Sec., Dr. Adam P. Leighton, 192 State St., Portland.

MARYLAND: *Examination*. Baltimore, June 21-24. Sec., Dr. Lewis P. Gundry, 1215 Cathedral St., Baltimore. *Homopathic*. Baltimore, June 14-15. Sec., Dr. John A. Evans, 612 West 40th St., Baltimore.

MASSACHUSETTS: *Written*. Boston, July 12-15. Sec., Dr. George L. Schadt, 413 E. State House, Boston.

MICHIGAN: * *Written*. Detroit and Ann Arbor, June 13-15. Sec., Dr. J. Earl McIntyre, 203 Hollister Bldg., Lansing.

MISSISSIPPI: Jackson, June 21-22. Asst. Sec., Dr. R. N. Whitfield, State Board of Health, Jackson.

MISSOURI: *Examination*. St. Louis, May 30-31 and June 8-10. Exec. Sec., Mr. John A. Hailey, Box 4, Jefferson City.

MINNESOTA: * Minneapolis, June 21-23. Sec., Dr. Julian F. DuBois, G. Leveck, S. Siegal and L. Ginzburg.—p. 989.

MONTANA: Helena, Oct. 3-5. Sec., Dr. Otto G. Klein, First National Bank Bldg., Helena.

NEBRASKA: * *Examination*. Omaha, June 6-8. Dir., Bureau of Examining Boards, Mr. Oscar F. Humble, 1009 State Capitol Building, Lincoln 9.

NEW JERSEY: *Examination*. Trenton, June 21-24. Sec., Dr. E. H. Hallinger, 28 West State Street, Trenton 8.

NEW YORK: Albany, Buffalo, New York and Syracuse, June 28-July 1, Sec., Dr. Jacob L. Lochner, 23 South Pearl St., Albany.

NORTH CAROLINA: *Endorsement*. Pinehurst, May 9. *Examination*. Raleigh, June 23-25. Sec., Dr. Ivan Procter, 226 Hillsboro St., Raleigh.

NORTH DAKOTA: * *Written*. Grand Forks, July 5-7. *Reciprocity*. Grand Forks, July 8. Sec., Dr. C. J. Glaspel, Grafton.

OHIO: *Examination*. Columbus, June 15-18. *Endorsement*. Columbus, July 5. Sec., Dr. H. M. Platter, 21 W. Broad St., Columbus.

OKLAHOMA: * Oklahoma City, June 8-9. Sec., Dr. Clinton Gallaher, 813 Bramm Bldg., Oklahoma City.

PENNSYLVANIA: *Examination*. Philadelphia and Pittsburgh, July. Acting Sec., Mrs. B. G. Steiner, 351 Education Bldg., Harrisburg.

PUERTO RICO: San Juan, Sept. 6-10. Sec., Dr. Luis Cueto Coll, Box 3717, Santurce.

RHODE ISLAND: * *Examination*. Providence, July 7-8. Chief, Mr. Thomas B. Casey, 366 State Office Bldg., Providence.

SOUTH CAROLINA: *Examination*. Columbia, June 27-29. *Endorsement*. Columbia, May 2, June 27-28, Aug. 1, Sept. 5 and Oct. 3. Sec., Dr. N. B. Heyward, 1329 Blanding St., Columbia.

SOUTH DAKOTA: * *Examination*. Pierre, July 19. Sec., Dr. G. J. Van Heuvelen, Capitol Bldg., Pierre.

TEXAS: *Examination*. Austin, June 16-18. Sec., Dr. M. H. Crabb, 209 Medical Arts Bldg., Fort Worth 2.

UTAH: *Endorsement*. Salt Lake City, May 25. *Examination*. Salt Lake City, July 13-15. Sec., Dept. of Registration, Miss Rena B. Loomis, 324 State Capitol Bldg., Salt Lake City.

VIRGINIA: *Examination*. Richmond, June 17-18. *Reciprocity*. Richmond, June 16. Dr. K. D. Graves, 631 First St., S.W., Roanoke.

WASHINGTON: * Seattle, July. Sec., Mr. Edward C. Dohm, Department of Licenses, Olympia.

WISCONSIN: * *Examination*. Milwaukee, June 28-30. Sec., Dr. C. A. Dawson, Tremont Bldg., River Falls.

WYOMING: Cheyenne, June 20. Sec., Dr. Franklin D. Yoder, Capitol Bldg., Cheyenne.

* Basic Science Certificate required.

BOARDS OF EXAMINERS IN THE BASIC SCIENCES

ALASKA: Feb. 1950. Sec., Dr. C. Earl Albrecht, Box 1931, Juneau.

ARIZONA: Tucson, June 21. Sec., Mr. Francis A. Roy, Science Hall, University of Arizona, Tucson.

ARKANSAS: *Examination*. Little Rock, May 3. Sec., Mr. L. E. Gebauer, 1002 Donaghey Bldg., Little Rock.

COLORADO: *Examination*. Denver, June 1-2. Sec., Dr. Esther B. Starks, 1459 Ogden St., Denver.

CONNECTICUT: New Haven, June 11. Exec. Asst., State Board of Healing Arts, Miss Mary G. Reynolds, 110 Whitney Ave., New Haven 10.

FLORIDA: *Examination*. Gainesville, June 11. Sec., Mr. M. W. Emmel, University of Florida, Gainesville.

MICHIGAN: *Examination*. Detroit and Ann Arbor, May 13-14. Sec., Miss Eloise LeBeau, 101 N. Walnut St., Lansing 15.

MINNESOTA: *Examination*. June and Oct. Sec.-Treas., Dr. Raymond N. Bieter, 105 Millard Hall, Univ. of Minnesota, Minneapolis.

OREGON: Portland, June 18, Sept. 3 and Dec. 3. Sec., Mr. Charles D. Byrne, State Board of Higher Education, Eugene.

SOUTH DAKOTA: Vermillion, June 3-4. Dr. G. M. Evans, 310 E. 15th St., Yankton.

TENNESSEE: Memphis, July 8-9. Sec., Dr. O. W. Hyman, 874 Union Ave., Memphis 3.

WISCONSIN: Milwaukee, June 4, Sept. 24 and Dec. 3. Sec., Prof. W. H. Barber, Ripon College, Ripon.

Current Medical Literature

AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1938 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied by stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Exposure to Sunlight and Night Vision.—Hecht and his associates state that reports from North Africa and the South Pacific during the last war suggested that night vision deteriorates after exposure to very strong sunlight, particularly on coral islands. The authors found that exposures to ordinary sunlight produced temporary and cumulative effects on night vision. A single exposure of two or three hours delayed the onset of rod dark adaptation by ten minutes or more and slowed the process itself so that the normal night vision threshold was not reached for several hours afterward. After repeated daily exposures to sunlight the delay in reaching the normal threshold persisted overnight, and the threshold after complete dark adaptation rose higher each day for about ten days and remained at a higher level. This elevated threshold corresponds to an average deterioration of about 50 per cent in visual acuity, range of visibility, contrast discrimination and in the frequency of picking up a target when it is barely visible. The effect shows considerable individual variation, but the average loss in night vision is nearly the same as is suffered by flying at 12,000 feet at night without oxygen. It is recommended that sunglasses transmitting 10 per cent or less of visible light be used by all persons who work in bright sunlight during the day and are expected to perform critical night duties soon afterward.

Surgical Treatment of Gastroduodenal Ulcers.—Colp and his co-workers performed vagotomy on 126 patients with duodenal, gastric and jejunal ulcer during the period from December 1945 to February 1948. In the first 33 patients the supradiaphragmatic approach and in 93 the infradiaphragmatic approach was employed. Vagotomy alone was practiced in 46

patients, vagotomy plus gastroenterostomy in 26 and vagotomy plus subtotal gastrectomy in 54. Vagotomy as a sole procedure has been abandoned in the treatment of unobstructed duodenal ulcer as a result of the author's experiences in a series of 22 cases because 7 of them required further surgical treatment, 2 for recurrent duodenal ulcer and 5 for gastric dilatation and atony. The completeness of the division of the vagi as evidenced by the insulin test bears no relationship to the clinical results. The addition of gastroenterostomy to vagotomy seems to have eliminated the undesirable effects of gastric atony in the 26 cases of duodenal ulcer in which it was performed. Whether the incidence of gastrojejunal ulceration will be lessened by the combination of vagotomy and gastroenterostomy, as compared with gastroenterostomy alone, only long range follow-up studies will determine. Gastroenterostomy combined with bilateral infradiaphragmatic vagotomy is the preferred procedure in cases of duodenal ulcer unsuitable for subtotal gastrectomy. The latter operation still remains the method of choice in duodenal ulcer. The immediate results of vagotomy in the treatment of gastrojejunal ulceration following gastroenterostomy and subtotal gastrectomy have been excellent. In patients considered to be good operative risks, a subtotal gastrectomy with infradiaphragmatic vagotomy is preferable to vagotomy alone for gastrojejunal ulceration following gastroenterostomy. In gastrojejunal ulceration following subtotal gastrectomy, resection of the ulcer and further gastric resection combined with infradiaphragmatic vagotomy would seem preferable to the severance of the vagus nerves alone. Vagotomy is not indicated in the treatment of gastric ulcer.

Intrathecal Therapy Contraindicated for Meningitis.—Hoyne maintains that on the basis of experience acquired in two contagious disease hospitals during a number of years there seems to be no justification for treating meningitis intrathecally. The objections to intrathecal therapy far outweigh any possible benefits. Objections to intrathecal therapy include the following: It causes the patient discomfort and pain; it has a tendency to produce opisthotonos; there is uncertainty that the amount injected is sufficient to control the infection; repeated spinal punctures increase the chances of introducing secondary infections; intervertebral disks may be injured which may result in permanent disability; it may cause hemorrhage or thrombosis of vessels, resulting in degenerative changes in the spinal cord, and it may produce adhesions, blocks and hydrocephalus and may retard recovery.

Rectal Operations and Undiscovered Cancers of Large Bowel.—McNealy and Smith were impressed by the frequency with which rectal operations had been performed in the presence of undiscovered cancer of the bowel. They reviewed the records of patients with carcinoma of the lower gastrointestinal tract. The survey was restricted to patients in whom a tumor mass could be felt by digital examination of the rectum, so as to preclude the common excuse that a lack of diagnostic instruments was responsible for the failure to discover the malignant

lesion. In 56 of 95 cases the tumor could be felt by digital examination; yet 42.8 per cent of this group were treated for bowel conditions other than carcinoma. A considerable percentage had undergone hemorrhoidectomies or fistulectomies or had hemorrhoids injected with sclerosing material. A correct diagnosis was not made because cancer was not suspected. The authors stress that coexisting rectal lesions are present in many patients with carcinoma of the rectum and that hemorrhoidectomy or other rectal surgery should not be performed until the presence of carcinoma is definitely ruled out.

Solitary Lung Tumors.—Effler and his associates point out that in the past, the accepted procedure has been observation over varied periods for the normal person who has an undiagnosed solitary lesion in the lung. The authors report 24 patients observed for eighteen months. Each of the 24 patients had a roentgen examination of the chest during a routine physical examination, and a round pulmonary lesion was discovered, which was completely asymptomatic. All of these patients were hospitalized and examinations were performed to make a concrete clinical diagnosis. There was never complete unanimity of opinion among the clinicians and radiologists as to the specific diagnosis. All tumors were considered benign, but operation was advised on the premise that diagnosis without tissue biopsy is only conjecture. In each case a thoracotomy was performed. Four of the 24 patients were found to have malignant lesions, and 7 had tuberculomas. The authors regard it as unfortunate that most doctors consider a tuberculoma an innocuous lesion, if it is not accompanied with roentgen evidence of active parenchymal disease. One of the cases here presented illustrates the complications that may follow in a patient with an untreated tuberculoma. This tumor was observed for almost two years while it progressed to central cavitation, whereupon the patient's sputum demonstrated acid-fast bacilli for the first time. Today thoracic surgeons generally agree that all tubercu-

lomas should be excised. The patients whose cases are presented here were comparatively young, having been observed in a military hospital. The authors believe that groups with a higher average age than this one would probably show a higher incidence of malignant tumors. The authors conclude that the question of malignancy can be answered only by tissue study of the entire lesion. Prolonged observation may prove disastrous in certain instances. With the continued refinement of surgical and anesthetic technics, exploratory thoracotomy has become an accepted procedure in all age groups.

Intrapelvic Obturator Neurectomy for Chronic Arthritis of Hip.—Key and Reynolds evaluate various operative attacks on painful hip, but concern themselves chiefly with intrapelvic obturator neurectomy, which is relatively simple and has a short convalescence. During the past one and one-half years they have performed this operation in 18 patients on one side and in 2 patients on both sides. The diagnoses in these patients were as follows: malum coxae scilicet, 7; old slipping of the femoral epiphysis, 2; traumatic arthritis following fracture of the hip, 2; proliferative arthritis both hips, 1; old pyogenic infection of the hip, 3; Paget's disease, 2; congenital subluxation of the hip, 1; congenital dislocation of both hips, 1; and a postoperative vitallium[®] cup arthroplasty, 1. Relief of pain was satisfactory in all except 4 of the patients. Since the intrapelvic section of the obturator nerve may cause almost complete paralysis of the adductors and result in weakness, instability and lack of endurance in the extremity, this operation would be reserved for those cases in which adductor spasm or contracture, or both, is judged to be a factor in the disability; in most instances in which an obturator neurectomy is to be performed the nerve should be exposed in the thigh at its exit from the canal and its deep or posterior branch and with it the sensory branch to the hip should be sectioned. This may or may not be combined with an acetabuloplasty. The surgeon should warn the patient that this is a palliative procedure and that it will not restore the hip to normal, but offers considerable lessening of the pain in about 80 per cent of the cases and that in most of these an appreciable improvement in the function of the hip may be expected.

Combined Approach to Obturator and Femoral Nerves.—In the course of treating patients with spasticity resulting from traumatic injury to the spinal cord, Freeman realized that ambulation with braces and crutches was often thwarted by the presence of adduction spasm. Frequently the spasticity seen in patients with paraplegia is flexor in nature. Adduction is principally accomplished through the muscles innervated by the obturator nerve, whereas flexion of the thigh is largely subserved by the muscles innervated by the femoral nerve. The author describes and illustrates a simple method for the combined bilateral section of the obturator and femoral nerves for the adequate relief of flexion and adduction spasm in patients with paraplegia.

Pseudocellulitis from Penicillin in Peanut Oil and Beeswax.—Lesnick and his associates observed 4 cases of severe delayed local reaction to penicillin in oil and beeswax. The reactions appeared seven to ten days after the first injection. They were characterized by the rapid appearance of tense painful swelling of the entire buttock associated with severe tenderness, generalized malaise and a temperature up to 102 F. In addition there was an erysipeloid skin eruption circular in shape, the center of the circle corresponding with the site of the needle puncture of the original injection. The central zone of this eruption was somewhat cyanotic and the edge of the eruption sharp and raised. The lesion reached its peak in forty-eight hours and then receded spontaneously in seven to ten days, leaving merely a small residual tender nodule in the subcutaneous tissues along the track of the original needle puncture. This nodule then slowly receded in a further fifteen to forty-five days. This reaction may be fairly common, since these 4 cases were observed in a series of 50 in which penicillin in peanut oil and beeswax had been administered. Other physicians have told the authors of similar experiences. Physicians and surgeons should be aware of this type of localized allergic reaction to penicillin in oil and beeswax, since it can be readily confused with an inflammatory lesion caused by infection.

Laryngeal Paralysis Associated with Cardiac Hypertrophy.—Land reports 4 cases in which laryngeal paralysis was attributable to a coexisting cardiac lesion. There was huskiness, hoarseness or weakness of voice. He discusses the theories that have been advanced with regard to the pathogenesis of this laryngeal paralysis and describes in a diagram the relations of the structures involved. Although the paucity of reports on this condition may indicate that it is infrequent, the author has gained the impression that it occurs more often than the scarcity of recorded cases might suggest.

Exertion During Preparalytic Stage of Poliomyelitis.—Hargreaves analyzed the effect of exertion during the preparalytic stage of poliomyelitis on the prognosis in 30 cases which occurred in Cornwall during 1947-1948. His observations support those of Russell, namely, that severe physical activity during the preparalytic stage is associated with grave prognosis. Severe mental strain, such as driving a car over long distances, appears to be equally disastrous, whereas paralysis tends to be mild in patients confined to bed during the preparalytic stage.

Denervation of Elbow Joint.—Bateman performed neurectomy on the elbow joint of 11 patients between the ages of 27 and 56, with post-traumatic arthritis and osteoarthritis. In each case the patient complained before operation of pain in the elbow, aggravated by activity and persisting at night. Based on the study of the innervation of 152 elbow joints from the ulnar, median, radial and musculocutaneous nerves, denervation as complete as possible and full exposure with stripping of nerve trunks are recommended. There were no complications. Immediately after operation there was a changed sensation in the elbow. Dragging and aching sensation had disappeared. When the wounds were healed, sharp and stabbing pain on movement was no longer experienced. The patient was able to sleep undisturbed. On resumption of activity, carrying the arm at the side was no longer painful, and the previous range of movement was regained without discomfort. Forced movement caused discomfort described as "stiffness" but without acute pain. In

all cases but one, improvement was maintained and the patients went back to their former occupations. There was recurrence of pain after six months in 1 patient with acute rheumatoid arthritis; in such cases denervation is not recommended until further study is completed. The results in this small series of cases are encouraging, but patients should be warned that there will be no significant increase in the range of movement and that a normal joint is not to be expected. Articular neurectomy is still on trial. If the limitations are recognized, the procedure may have a useful place in the relief of pain in the elbow joint.

Ischiofemoral Arthrodesis.—Brittain performed ischiofemoral arthrodesis on 95 patients, 38 of whom had tuberculosis of the hip, 52 osteoarthritis of the hip and 5 infective arthritis of the hip. The basis of this operation is the use of a wide tibial graft, which is more certain to engage in bone in the ischium. The osteotomy performed in an ischiofemoral operation confers a unique advantage on the tuberculous hip, in that the disease can be changed from the serious problem of joint disease to the less serious one of bone disease. One of the essential features of the operation is that it is closed, and its success may depend on this. Wider exposures which mobilize both femoral fragments lose the advantage of fixation of the graft between the fragments and may cause nonunion. Thirty-two fusions occurred in the 38 patients with tuberculosis of the hip; forty-five fusions occurred in the 52 patients with osteoarthritis, and fusion occurred in all 5 patients with infective arthritis of the hip. Thus the proportion of successful fusions in this series of patients treated by ischiofemoral arthrodesis was over 80 per cent.

*Intraperitoneal Hemorrhage Due to Rupture of Graafian Follicle with Presentation of 3 Cases. W. Lowen.—p. 597.
Reiter's Disease. M. W. Fletcher.—p. 600.

Intraperitoneal Hemorrhage and Rupture of Graafian Follicle.—Lowen reports 3 young women, aged 18, 21 and 15, respectively, who had intraperitoneal hemorrhage due to a ruptured graafian follicle. Laparotomy was done in all 3, and in 1 a tear was observed on the right ovary through which an oval piece of tissue protruded. This was shelled out and the rent in the ovary was oversewn. Microscopic examination of the removed specimen suggested a graafian follicle distended with blood clot. In the other 2 patients ruptured cysts were found on an ovary. Cases of intraperitoneal hemorrhage due to rupture of a graafian follicle or corpus luteum retention cyst are not excessively rare. The total number of cases reported to date is approximately 500. The peritoneum may contain from a few cubic centimeters to 1,500 cc. of blood. The symptoms vary accordingly. The condition is most frequently misdiagnosed as acute appendicitis. The next most common mistake is confusion with a ruptured ectopic pregnancy. In the severe forms of rupture of the graafian follicle, a preoperative diagnosis is difficult, but laparotomy is usually done anyway. The following are the main points which are to help in the differentiation of this condition: 1. It occurs most commonly in the second and third decades of life. 2. The onset of symptoms occurs between the fourteenth and the twenty-first day after the last menstrual period. 3. Pain is invariably present. It is of sudden onset and usually starts in either right or left iliac fossa. Later it is diffused. 4. Nausea is present in the majority of cases, but vomiting is rare. 5. Tenderness varies in degree. 6. The temperature is normal or only slightly elevated. 7. Vaginal examination can help occasionally. Usually the cysts are too small to be palpable, but ovarian tenderness may help in distinguishing this condition from appendicitis. Unless signs of massive intra-abdominal hemorrhage are present, the treatment should be conservative. In cases in which preoperative diagnosis of appendicitis is made and is not confirmed at operation, the condition should be borne in mind and looked for.

- *Methylthiouracil in Treatment of Congestive Heart Failure and Angina Pectoris. Results of Prolonged Treatment. A. Rune Frisk and Inga Lindgren.—p. 69.

Methylthiouracil in Congestive Heart Failure.—Frisk and Lindgren gave methylthiouracil to 7 patients with chronic congestive heart failure and to 9 patients with angina pectoris. None of the patients showed signs of hyperthyroidism. The initial dose was 400 or 500 mg. per day (divided into 100 mg. doses). After discharge from the hospital the dose was reduced to three daily doses of 100 mg. each. Later the dose was further reduced to 200 or 100 mg. per day. Four of the 7 patients with congestive heart failure were considerably improved and for a long time remained in this condition. Three patients showed moderate improvement. In 2 of these cases further therapy was stopped because of toxic reactions to the drug; the third patient relapsed in spite of continuous treatment. In 8 of 9 patients with angina pectoris there was lasting improvement during long-standing treatment with methylthiouracil. It was possible to record this improvement objectively by means of hypoxemia tests and exercise tolerance tests. As a rule, three to six months of treatment must elapse before improvement is noticed, and, with the dosage used, six to eight months of therapy were required before reduction of the thyroid function could be clinically proved. When the thyroxin storage of the thyroid gland is exhausted it becomes easy to maintain the metabolic rate at a desired low level with small daily doses (15 to 50 mg.). The authors aimed at metabolic values of about minus 15 per cent. In most cases there was a coincidence of symptomatic response and of response of the basal metabolic rate. In 5 cases in which there was definite improvement, however, there was no pronounced lowering of the basal metabolism. In these cases there was usually a rise in serum cholesterol indicating the blocking effect of the drug on the synthesis of thyroxin.

- *Folic Acid in Treatment of Nervous Syndrome of Pernicious Anemia: Behavior of Vibrating Sensation. M. Abu Jamra, H. Martins Canelas and J. M. Taques Bittencourt.—p. 301.

Folic Acid in Treatment of Nervous Syndrome of Pernicious Anemia.—Abu Jamra and collaborators administered folic acid to 7 patients with pernicious anemia, complicated by combined degeneration of the spinal cord. The clinical evolution was studied by repeated neurologic examinations, special attention being given to the vibratory sense. Tuning forks with frequencies of 32 (C¹), 65 (C), 128 (c) and 256 (c¹) double vibrations per second were used. The results obtained proved that the hematologic effect is not as pronounced as that which is obtained with liver extract. The pyramidal and posterior cord symptoms greatly improved in 2 cases. The pyramidal symptoms, but not the posterior cord symptoms, were improved in the 2 cases, whereas the reverse occurred in 1. The neurologic symptoms did not change in 2 cases.

- *Sulfur and Arteries. J. Vignalou.—p. 513.
- Diaphragmatic Hernia and Diaphragmatic Eventration. M. Demoulin.—p. 517.

Sulfur and Arteries.—Animal experiments by Vignalou showed that administration of sodium hyposulfite for eight days reduces the hypertension produced by venous perfusion with tyramine. The lowering of the arterial tension does not occur after the first injections but requires some time, suggesting that the effect of the drug depends on its combination with one of the substances which are responsible for the hypertension. A tyramine sulfuric acid was obtained by Loeper and Parrod by combining in vitro sulfur and tyramine. When injected into

animals this compound no longer possesses any of the vasoconstrictor and hypertensor properties of tyramine. Animal experiments showed that hypertension is less pronounced and of shorter duration in an animal to which a tyramine injection was given after 3 Gm. of sodium hyposulfite had been administered previously in the course of several days. A supposition seems to be warranted that the tyramine combines with the sulfur in the organism as in vitro and that in the blood the sulfur causes a true blockage of the hypertensor phenylamines. Progressive lowering of the arterial tension resulted in 4 of 10 patients with hypertension to whom intravenous injections of 1 to 2 Gm. of sodium hyposulfite were given daily. Two of 7 additional patients with hypertension, who were given the same treatment, were definitely improved; the blood pressure was lowered and the tyramine level was reduced after the third or fourth week of the treatment. In 1 of them, a young woman with severe hypertension, the improvement persisted for several months during which treatment was continued with a series of ten to twelve injections per month. In 3 other cases the functional sensory disturbances were rapidly relieved but lowering of the arterial tension was only transitory. In 2 treatment was a failure. Sodium hyposulfite is effective in patients with neurovascular hypertension whose arterial lesions are discrete and in whom the carotid sinus reflex is considerably increased.

Therapy of Infectious Rheumatism with Congo Red.—Jiménez Díaz and collaborators report on the treatment of chronic infectious rheumatism with congo red by the intravenous route. The authors used a 1 per cent solution of congo red in doses varying from 5 to 10 cc. of the solution. The injection should be given slowly to prevent reaction. It is given every other day, up to a total of twenty injections in forty days. The treatment can be repeated after an interval of rest of three weeks. The authors report good results in a group of patients.

Acute Osteomyelitis of Infants and Adolescents.—Favreau reports 30 cases of acute osteomyelitis in infants and adolescents. Ten patients between the ages of 2 and 19 years were treated before 1937; i. e., before the era of the sulfonamide compounds. Treatment consisted of trephining of the medullary canal, curettage of the necrotic zone, autovaccine and plaster cast. Two patients died. The average hospital stay was two hundred and fifty-four days and the average time required for recovery was twenty-six months. Ten patients between the ages of 4 and 15 years were treated during the period from 1939 to 1944. Treatment consisted of local and oral administration of sulfonamide compounds in addition to trephining, curettage and plaster cast. There was not a single fatal case; the average hospital stay was sixty-nine days and the average time required for recovery was seven months. The response of the infants to the treatment with sulfonamide compounds was better than that of the adolescents. Pneumococcus rather than Staphylococcus aureus was demonstrated as the causative agent in the infants. Ten patients between the ages of 2 weeks and 11 years were treated during the period from 1944 to 1946. Treatment consisted of local administration of sulfonamide compounds and injections of 200,000 to 630,000 units of penicillin in addition to trephining, curettage and plaster cast. There was not a single fatal case, the average hospital stay was thirty-three days and the average time required for recovery was three months. Mortality disappeared. The course of the acute osteomyelitis was influenced most favorably by chemotherapy combined with surgical treatment.

Book Notices

The Therapeutic Value of Penicillin: A Study of 10,000 Cases. By Donald G. Anderson, M.D., Secretary, Council on Medical Education and Hospitals, American Medical Association, Chicago, and Chester S. Keefer, M.D., Professor of Medicine, Boston University School of Medicine, Boston. Fabrikoid. Price, \$7. Pp. 297. J. W. Edwards, 300 John St., Ann Arbor, Michigan, 1948.

This book is of special historic interest, since it represents the report of the first extensive nationwide study to determine the clinical use of a chemotherapeutic agent. Before penicillin became generally available for use in this country, its distribution and use were controlled by the Committee on Therapeutics and Other Agents of the National Research Council. During the period between 1942 and 1945, detailed reports of the use of penicillin in more than 10,000 patients were submitted to this committee. The reports were arranged according to etiologic and anatomic diagnoses and analyzed statistically, and the findings were commented on by the authors.

The conclusions reported in this book are only very generally applicable to the administration of penicillin at the present time. The doses and methods of the administration of penicillin have changed greatly, even in the short period that has elapsed since this study was undertaken. In the early months of penicillin therapy, the antibiotic was used largely in carefully selected patients, many of whom were seriously ill when therapy was begun and had failed to respond to other forms of therapy. The book presents much valuable information, however, since the experience recorded represents the largest number of cases of certain of the more unusual diseases treated with penicillin yet reported.

Health Progress 1936 to 1945: A Supplement to Twenty-Five Years of Health Progress. By Louis I. Dublin, Ph.D., Second Vice-President and Statistician, Metropolitan Life Insurance Co., New York. With the collaboration of the Staff of the Statistical Bureau. Paper. Pp. 147, with illustrations. Metropolitan Life Insurance Co., 1 Madison Ave., New York 10, 1948.

Excluding deaths from enemy action, the standardized death rate from all causes decreased 26 per cent in the decade 1936-1945 among persons insured by Metropolitan Life Insurance Co. at ages 1 to 74. Decline in mortality was experienced by each of the four color-sex groups. Reductions in mortality were observed in every age group, particularly in the younger age groups. Partial elimination of infectious and childhood diseases, which accounted for the sharp decline in mortality at the younger ages, enabled persons to live to an older age and as a result increased the importance of diseases of the aged.

Tuberculosis and pneumonia dropped to sixth and eighth place. Accidents moved up to fifth place as a major cause of death.

Standardized death rates for color, sex and age have declined markedly in communicable diseases of childhood, with a decline of 85 per cent in scarlet fever. For all forms of tuberculosis combined the standardized death rate among the insured declined 41 per cent over the ten year period, with material improvements in each color-sex and age group. However, it is still a primary cause of death among the young.

Pneumonia and influenza have been sharply reduced through the introduction of the wonder drugs. In 1945 these two diseases accounted for only 4 per cent of all deaths among the insured.

The percentage of deaths due to the diseases of the aged, such as cardiovascular-renal diseases and cancer, has increased throughout the interval studied. In spite of this increase the death rates for these diseases decreased when standardized for the aging of the population. In fact, there was a drop in the standardized mortality rate for all causes of death except accidents. Even though the importance of tuberculosis and pneumonia has been reduced they still account for a large number of deaths. The conquest of certain types of pneumonia requires further medical research. Newer methods of treatment, expansion of nursing facilities and improved health habits will assist in the control of all causes including those peculiar to the aged, but it must be recognized that death cannot be postponed forever. As the diseases of the young are controlled it is natural that the diseases of the aged must increase in importance.

Infra-Red Irradiation. By William Beaumont, M.R.C.S., L.R.C.P., Director of Physical Medicine, Westminster Hospital, London. With a foreword by Lord Horder, G.C.V.O., M.D., F.R.C.P. Third edition. Cloth. Price, 8s.6d. Pp. 161, with 32 illustrations. H. K. Lewis & Co., Ltd., 6 Gower St., London, W.C. 1, 1948.

This is the third edition of a useful and concise small monograph on the medical applications of infra-red radiation. In the foreword Lord Horder states, "At a time when physical therapy seems at last to be coming into its own in this country, we welcome Doctor Beaumont's concise and yet complete treatise upon infra-red irradiation."

Six years of war have intervened since the issuance of the previous edition and the author points out that during this time there has been a tremendous increase in the use of infra-red irradiation. The new edition has been entirely revised and two new chapters have been added; many of the old illustrations have been replaced. There are chapters on terminology, physical basis, physiologic effects, apparatus, technic, treatment of common symptoms, application to disease and combined treatments and on the recording and analysis of cases.

While this book is not an exhaustive one for the specialist in physical medicine, it is a satisfactory elementary guide in the fundamentals of infra-red radiation for the average medical practitioner and can be highly recommended for this purpose.

Oral and Dental Diseases: Aetiology, Histopathology, Clinical Features and Treatment: A Textbook for Dental Students and a Reference Book for Dental and Medical Practitioners. By Hubert H. Stones, M.D., M.D.S., F.D.S.R.C.S., Professor of Dental Surgery and Director of Dental Education, University of Liverpool, Liverpool. Cloth. Price, \$18. Pp. 396, with 926 illustrations. Williams & Wilkins Co., Mount Royal and Guilford Aves, Baltimore 2, 1948.

In the preface to this first edition the author states: "As oral lesions may be of a serious nature, sometimes being local in origin and at other times the manifestations of systemic disease, it is important that medical as well as dental practitioners should recognize such lesions and appreciate their significance." With this as a theme, the forty-two chapters which follow are in a logical and comprehensive order.

Another statement made in the preface is "When reviewing the dental tissues, though certain characteristic features are involved, they must not be dissociated from the system as a whole. Thus, when considering various aspects of dental diseases, as well as other oral diseases, it is necessary to utilize the resources and knowledge of a wide scientific field." The extensive bibliographies found at the end of each chapter indicate the author's familiarity with pertinent scientific literature and also furnish the reader with a vast amount of material for further reading.

Each chapter contains numerous illustrations. The photographs, charts, photomicrographs, colored photographs, drawings and roentgenograms are, in most instances, very good and nicely reproduced for publication. It is well to comment on the roentgen reproductions, which are not reversed or positive prints, but are duplications of the original film and can be read as such.

This new volume is meant to cover a vast amount of material—some of the dental material is rather inadequately covered, and some of the medical material is also treated in a superficial manner. The logical and comprehensive method and order of presentation, the complete extensive bibliographies at the end of each chapter and the many excellent colored illustrations make this volume a valuable adjunct to any dental or medical library.

Therapeutisches Taschenbuch für Ärzte und Studierende. Herausgegeben von Dr. Med. G. Ruepp. Bearbeitet von Prof. W. Burckhardt, et al. Cloth. Price, 12 Swiss francs. Pp. 394. Hans Huber, Marktgasse 9, Bern 16, 1948.

This book, which is written in German, provides brief résumés of the information considered essential by the author for a proper understanding of the causes and treatment of diseases. The diseases are arranged alphabetically in the book. However, the information presented is so brief that the booklet becomes little more than a handbook, or one that students would use for cramming. Furthermore, it obviously does not come up to the standards of the better American books, nor is it up to date so far as treatment on this continent is concerned.

Queries and Minor Notes

THE ANSWERS HERE PUBLISHED HAVE BEEN PREPARED BY COMPETENT AUTHORITIES. THEY DO NOT, HOWEVER, REPRESENT THE OPINIONS OF ANY OFFICIAL BODIES UNLESS SPECIFICALLY STATED IN THE REPLY. ANONYMOUS COMMUNICATIONS AND QUERIES ON POSTAL CARDS WILL NOT BE NOTICED. EVERY LETTER MUST CONTAIN THE WRITER'S NAME AND ADDRESS, BUT THESE WILL BE OMITTED ON REQUEST.

BLOOD ALCOHOL CONTENT IN INTOXICATION

To the Editor:—In a recent case which came before a court, a man was arrested for drunken driving, but refused to have a blood alcohol test taken at the time of the arrest. About five hours later he permitted the taking of the test, which showed an alcohol content of 50 mg. per cent (0.05 per cent by weight). The question now arises as to what the blood content of alcohol was at the time of the arrest. In the literature at hand I have not been able to find any definite statement as to the rate of loss of alcohol from the blood after one stops imbibing. Please give references in which this information may be obtained.

Roy S. Wyckoff, M.D., Lexington, Neb.

ANSWER.—Mellanby's experiments have indicated (Alcohol: Its Absorption into and Disappearance from the Blood Under Different Conditions, Medical Research Council, Special Report Series, No. 31, His Majesty's Stationery Office, London, 1919) that alcohol is lost from the body at the rate of 7 to 10 cc. per hour. These findings have had adequate confirmation. More recent research by Haggard and his associates (*Quart. J. Stud. Alcohol* 1:4, [March] 1941) explain some of the variations in the rate of loss of alcohol from the body by pointing out that the rate of absorption of the alcohol from the alimentary tract is a primary factor in determining the shape of the alcohol curve. Further variations in the rate of loss of alcohol from the body depend on the body weight of the subject. According to Haggard, an average-sized person, 65 to 79 Kg., eliminates alcohol at a rate of 5.2 to 6.3 Gm. per hour.

Assuming that the arrested man had done all of his drinking one or more hours before the arrest, and that he weighed 150 pounds (68 Kg.), he would have had in his body at the time the specimen was taken approximately $0.0005 \times \frac{2}{3} \times \frac{4}{5} \times 150 = 0.066$ (pounds alcohol) = 30 Gm. This approximation is based on the knowledge that the alcohol in the body distributes itself uniformly in the water of the body; that the body is about two thirds water, and that the blood alcohol is to the body water alcohol as 3 is to 4. Five hours previously the body would have contained an additional 30 Gm. assuming the conservative rate of loss of alcohol of 6 Gm. per hour. The alcohol in the blood at that time would have been about 0.10 per cent by weight. This amount is usually associated with symptoms of intoxication, although there is no indisputable proof of "under the influence" until the alcohol in the blood reaches 0.15 per cent. (Report of the Committee to Study Problems of Motor Vehicle Accidents [approved by House of Delegates] J. A. M. A. 124:1290 [April 29] 1944.)

PENICILLIN REACTION

To the Editor:—An 80 year old man, a retired physician, fell ill suddenly and underwent removal of the gallbladder and gallstones. This occurred last July. He now looks as robust as before the operation. He was given large doses of penicillin while hospitalized and has suffered torture from pruritus ever since leaving the hospital.

What remedy will modify this itching? Eruption consists of papules and small pustules. Intensity of the itching has decreased, and rubbing with a rough bath towel allays it. What is the usual course in such allergy?

Fayette C. Ewing, M.D., Pineville, La.

ANSWER.—Allergic reactions to penicillin do not last four months. It is possible that the initial reaction was from penicillin and that this was followed by sensitivity to other substances or perhaps by traumatization of the skin. Is the patient using other drugs, such as acetophenetidin, acetylsalicylic acid, barbiturates, phenolphthalein or sulfonamide compounds? It may be, of course, that allergy is not involved now. Systemic causes for itching, such as diabetes, icterus, blood dyscrasias and Hodgkin's disease, should be ruled out. Physical factors such as heat or cold may be a cause, and psychogenic influences have to be considered.

The remedy would depend on the cause. For symptomatic relief the antihistaminic compounds (tripelennamine hydrochloride, diphenhydramine, hydrochloride, neoantergan® [N-p-methoxybenzyl - N - dimethylaminoethyl - alpha - aminopyridine] thenylpyramine hydrochloride) would likely constitute the most effective remedy. Tripelennamine cream or ointment may be of aid. Acetylsalicylic acid is frequently helpful. Sedatives may be needed.

JEWELWEED

To the Editor:—From time to time we have had reports from certain of our men that they were using the juice from a weed to counteract harmful effects after exposure to poison ivy. This juice was used even after the rash had begun to form and inflammation appeared. Last week I had occasion to investigate this matter further and also to secure samples of the weed, which I brought down to a botanist at Lawrence College. He identified the weed as the jewelweed, with the botanical name *Impatiens*. The weed is found in many parts of the state, but we are definitely aware of its presence in areas north of Appleton, around Waupaca, and in the vicinity of the Menominee River in our northern territory. The thing that concerns us at this time is whether or not the juice of the jewelweed is an effective antidote for poison ivy. If it is, our men should be informed, but if it is not, there is grave danger of doing more harm than good.

M.D., Wisconsin.

ANSWER.—Extracts of jewelweed (*Impatiens*) have been used empirically for many years both in the prevention and the treatment of poison ivy dermatitis. Since no published data on the effectiveness of this plant in the prevention and treatment of ivy dermatitis could be found, I conducted experiments with the fresh sap and ether extracts of jewelweed (*Impatiens*) obtained from the state of Iowa and with an extract of the plant manufactured for the treatment of poison ivy in the vicinity of Baltimore, and furnished by the late Dr. Pels. Neither the fresh juice nor the extract of the plant was of any value in preventing the development of poison ivy dermatitis and liberal applications of both the fresh juice and the extract did not hasten the healing of poison ivy eruptions.

Jewelweed, the coneflower (*Echinacea*), the gum weed (*Gnaphalium*), the red bud (*Cercis*), wormwood (*Artemisia*), bloodroot (*Sanguinaria*), boneset (*Eupatorium*), and a host of other plants have been used empirically in the prevention and treatment of poison ivy eruptions. Proof that any of these are of value is lacking.

TERMINAL HEMATURIA

To the Editor:—Recently three boys, ages 2, 5 and 11, complained of passage of gross blood during the terminal phase of urination. Physical examination was negative. All denied trauma. The tuberculin skin reactions were negative. The three glass test showed gross blood in the third glass, with only an occasional cell in the other two. Within forty-eight hours the urine samples became negative and the patients felt well. No cultures were made of the urine. Weekly urinalysis for several weeks has remained negative for each child. What is the most likely type of disturbance?

M.D., Oklahoma.

ANSWER.—Terminal hematuria, as described in the 3 boys, would indicate localization of its source to the posterior urethra. The three glass test is not always exact in its localization of a lesion, however, so that the bladder and upper part of the urinary tract cannot be entirely excluded. Some type of infection would seem to be the most likely lesion. Examination of the urinary sediment by means of Gram's stains and cultures is essential. An inflammatory lesion may exist occasionally when the urine is negative on microscopic examination and on culture. Trauma secondary to masturbation also is a factor to be considered. If the hematuria persists, roentgenographic and cystoscopic examination should be employed for exact identification of the source. A complete roentgenographic examination of the urinary tract is essential in every case of hematuria. Although calculi in the kidney, ureter, bladder or urethra are unusual in children, nevertheless they do occur. Neoplasm in the urinary tract does not occur in children often; however, it also should be excluded, preferably by cystoscopic examination and urography.

PITYRIASIS

To the Editor:—Is Pityriasis lichenoides at varioliformis acuta usually accompanied by pruritus?

Walter Weinberger, M.D., Altoona, Pa.

ANSWER.—Some patients do complain of itching, although severe itching is not a characteristic symptom of this disease.

ENCEPHALITIS IMMUNIZATION

To the Editor:—In *Queries and Minor Notes* of Dec. 11, 1948, the statement is made, "Immunization against the Japanese type of encephalitis is still in the stage of animal experimentation and has not been applied to human beings."

The Army Medical Department prepared Japanese encephalitis vaccine, chick embryo type, for use in all troops stationed in Japan and Okinawa during the years 1946, 1947 and 1948. A mouse brain type was used in 1945. We will continue the use of the vaccine in 1949, having already completed plans for production. The method of administration is essentially that of any other type of vaccine in that basic immunizing doses are given, followed by a booster dose each succeeding year.

The evaluation of the vaccine has not been completed and the information available at this time does not justify definite conclusions. We strongly believe from the experience we have had that the use of the vaccine should be continued.

WHAT FURTHER CONTRIBUTION CAN RADIOLOGY MAKE TO MEDICINE?

Chairman's Address

W. WALTER WASSON, M.D.
Denver

As Chairman of the Section on Radiology, I wish to take this opportunity to pay my respects to the older generation of radiologists who have contributed so much to the science of radiology and who have left such a wonderful heritage to medicine. To the younger generation of radiologists I wish to say that much progress can yet be made. It has been said that radiology has reached its "peak." I am not in accord with this opinion, and I do not believe that radiology has reached its peak, in either the field of diagnosis or that of therapy. The roentgen ray has become so basic to the practice of medicine that it will be used in some form as long as there are diseases to diagnose and patients to treat. Furthermore, being basic in its portrayal of anatomy and of physiologic and pathologic conditions, or the treatment of these conditions, its development will be in direct ratio to the progress made in our knowledge of these diseases.

Research studies will continue to be necessary for advancement in the field of radiology. While accidental discoveries may be made, as in all branches of science, the greater progress will be made by well planned research. At present, the radiologists competent to do research are too busy with the daily routine to attempt any amount of well organized research. This situation will be corrected as more radiologists are available for the general routine practice of radiology. However, research investigations are not necessarily limited to large institutions where there is a large mass of material for study. As a matter of fact, radiologists can derive a great deal of benefit and pleasure from the continual research studies in their own private offices and from small groups of cases well investigated and analyzed. Such studies should be encouraged.

In the field of therapy, radiologic equipment has improved faster than the ability of the radiologist to understand and utilize it. The mechanical factors involved in the use of the therapy equipment almost requires the knowledge and experience of a trained physicist to utilize fully the possibilities of this apparatus. At the same time, the application to the patient necessitates a detailed knowledge of medicine. Again, the expense of this equipment is frequently beyond the range of the average radiologist. Already skill in manufacturing is not only simplifying apparatus but also reducing costs. It is therefore possible to visualize

a much wider distribution of efficient equipment. However, progress in the field of radiation therapy will depend on the radiologist's ability to understand the possibilities of his equipment and its application to the disease which he wishes to treat. Such ability, at the present time, is limited to a very few radiologists, and these same radiologists are handicapped by a lack of time for progress in research. In the treatment of malignant disease, 100 per cent accuracy in diagnosis and treatment is almost absolutely necessary, together with the daily observation of the patient. Furthermore, our knowledge of the therapeutic dosages of any form of irradiation is still inadequate. As recently pointed out by Martin, in spite of its importance, the time factor is still very poorly understood. Complete ionization of the rays within the tumor cells is the desired goal in radiation therapy, and yet various radiologists are observed to use voltages from 140 to 1,000 kilovolts for the treatment of similar tumors in similar cases. It does not seem that such a wide range of kilovoltage can be correct. In other words, there is at hand a wide range of voltage for the treatment of disease with roentgen rays, and much progress will be made when there is better knowledge for the selection and application of voltage.

The reactions within the body cells, either tumor or other tissue cells, as a result of the application of some form of irradiation are still poorly understood. In spite of all the research that is being carried on, there have been inadequately detailed studies of such tissue cell reaction. Until such information is available, a truly scientific application of irradiation cannot be had. As just suggested, it makes a great deal of difference as to whether the rays applied to the surface of the body are completely ionized within the tumor cell and as to whether this ionization is a lethal dose for that tumor cell or whether it is a fraction of a lethal dose and repeated at some indefinite time. For the ultimate in the treatment of disease, it is evident that the radiologist must have an intimate knowledge of the pathologic changes in the disease which he is undertaking to treat. Time will simplify many of these problems and will bring to the radiologist the knowledge of his apparatus and of the disease, so that there will be definite increased efficiency in his treatment of diseased conditions.

CHEMOTHERAPY AND RADIATION THERAPY

It is known that some diseases are due to a virus infection, in which the virus is intracellular and cannot be reached by chemical therapy. There is the possibility that the use of radiation therapy for the destruction of such cells may make chemical therapy more effective. This theory has a similar application already recognized in the treatment of infection in which the leukocytes are broken down by the roentgen ray and

Read before the Section on Radiology at the Ninety-Seventh Annual Session of the American Medical Association, Chicago, June 23, 1948.

enable the blood plasma to have access to the bacteria. The field of chemical therapy is still very young, and it may be found that the roentgen or radium ray needs the aid of such chemical therapy for the destruction of tumor cells which are now highly resistant to such irradiation. There is already some evidence that, while testosterone or diethylstilbestrol may have little value in the treatment of certain malignant conditions and while the roentgen or radium rays by themselves may have little value in such treatment, the combination of this testosterone or diethylstilbestrol and radiation therapy may have a most desired result. Such investigations of chemical therapy offer considerable promise for the future. Likewise, the use of radiation therapy in the treatment of ordinary infections of a wide variety has had insufficient usage. The radiologist has been too busy with the treatment of more serious conditions.

RADIOACTIVE ISOTOPES

A more recent addition to the field of radiation therapy has been the radioactive isotopes. While the use of the radioactive isotopes has been of definite help in the treatment of a few diseases, their greatest value has been in the study of physiologic processes. It is as yet too early to say what ultimate contribution the radioactive isotopes will make to radiation therapy. The very knowledge of nuclear physics which they bring may be the deciding factor necessary for the study of the effect of irradiation on the tissue cells. Certainly, medicine can expect not only advance in the knowledge of the effects of irradiation on tissue cells, but also a wider and more efficient application of this knowledge to the sick patient. Television clinics will definitely aid in the transmission of this scientific information to a larger and larger group of radiologists.

DIAGNOSTIC ROENTGENOLOGY

In the field of diagnostic roentgenology, it would seem that after all the ingenious methods for utilizing the roentgen ray in diagnosis one could not expect much further progress. Extensive contributions have been made to the diagnosis of almost every disease—as to its development, character and methods for treatment—but newer diagnostic methods are continually being revealed, as evidenced by the recent developments in angiocardiology and photoroentgenography and of the use of the electronic fluoroscope as proposed by Chamberlain. This fluoroscope with its great increased intensity of the light image can revolutionize diagnostic procedures. Color photography as applied to the roentgen ray has not yet been successful. New methods of living continually develop new types of diseases, as in the field of industry, and the radiologists have met this challenge by developing methods for the study and diagnosis of such new diseases.

ROENTGEN FOLLOW-UP

Roentgen examination following the administration of various pharmaceutical products has been used to some extent, but its possibilities for the study of the action of drugs on both animals and human beings have not been fully explored. After the administration of a drug, the roentgen examination can be and has been employed to study the effect of this drug either on the physiologic processes of the body or its beneficial effect for the treatment of disease. The control of drug administration can be much more accurately directed by such studies. Likewise, the results of surgical treatment can often be more definitely deter-

mined by roentgen examination than by the ordinary observation of the patient.

It can be said that most of the efforts in the development of methods for the diagnosis of diseases with the roentgen ray have been directed toward the acute illnesses. As previously stated, the roentgen examination is basic in the practice of medicine in that it portrays not only normal anatomy but the physiologic and pathologic variations of this anatomy. In fact, such an examination, as one of the abdomen, may often be superior to surgical exploration, and it may rank next to an autopsy as to the extent of organs visualized and in the accuracy of their portrayal.

ROENTGEN LIFE SPAN STUDIES

If our very ingenious methods of roentgen diagnosis were applied to the examination of the human being from infancy to adult life, there would be roentgen records of a life span of a patient's anatomy, and by demonstrating the physiologic and pathologic changes they would reveal the beginnings of the organic diseases. With the present understanding of the effects of the roentgen examination and modern methods, it is possible to make such repeated examinations without risk to the patient. The short exposure technics have made the roentgen examination of the young infant a daily and almost routine procedure and have given the pediatrician the valuable bit of information so necessary to his diagnosis. The young infant is not able to describe his pain. After the achievements of radiology in the diagnosis and study of the acute illnesses, it would seem that radiology's responsibility to medicine would be now to attack the problems of the chronic diseases which so often have their beginnings in infancy and early childhood and which kill at 50. This is not a new theme, as I have spoken of this before, but I do not believe that the radiologists are yet thinking in terms of the conquest of the chronic diseases. This is chiefly due to the fact that no radiologist follows the same patient long enough to observe the beginning of a chronic illness and its fatal termination, and the radiologists have been too busy with the diagnosis of acute illnesses which are often more demanding of attention. On the other hand, it is my opinion that when radiology does earnestly attack the problem of the recording of the beginning and progression of the chronic illnesses it will make one of its greatest contributions to medicine. I know that this will be done. Already certain research investigations have proved its importance and feasibility. The study of only an occasional patient from infancy through life, in either a large clinic or a private office, is most stimulating in its revelations. The pediatrician has his own pediatric hospital or ward in the general hospital, and the internist has his separate hospital. The internist, in general, is not interested in the child, and the pediatrician is not interested in the adult. In other words, there has been no important correlation for the study of disease between the physicians interested in the infant or young child and those interested in the adult. It is most important for the physician to realize, when seeing a patient with an acute exacerbation of a chronic disease, that the underlying pathologic process has been present for years. There are a few radiologists interested in such studies, and there has been an occasional organized effort to study the life span of the chronic diseases, but usually such efforts are ultimately confined to studies of growth and development, and the

possibilities of roentgen study are neglected. The roentgen examination where combined with well planned physical and laboratory examination can record the changes in human anatomy over a period of many years and can reveal those processes within the body which cannot be determined by any other method. When the life span of the chronic disease is recorded it will be a most fascinating story of the physiologic activities of the body and of the attack on them by pathologic processes which bring destruction. Therefore, it can be expected that radiology will not only continue to keep pace with the rest of medicine in the study of acute illnesses as the newer diseases appear but will also respond to its responsibility and make another great contribution to medicine in its study of chronic diseases.

ACUTE OBSTRUCTION OF THE SMALL BOWEL

F. A. COLLER, M.D.

and

R. W. BUXTON, M.D.
Ann Arbor, Mich.

The physiologic and pathologic abnormalities caused by acute obstruction of the small bowel have been studied in many clinics and laboratories. The result has been a better understanding of the problem, but the mortality rate for these lesions is still high. A survey of 198 patients with this lesion, observed in the University Hospital in the years 1934 to 1947, has been made and subjected to critical analysis, with the hope of improving the diagnosis and treatment in similar cases in the future. In all patients included in the study the diagnosis of mechanical intestinal obstruction and its causation was confirmed by operation or necropsy. Patients with primary paralytic ileus and those with nonoperative relief of obstruction have been excluded. It is now recognized¹ that the fluids lost by vomiting and other mechanisms, together with the absent intake of food and drink, result in profound dehydration from water and electrolyte deficiency. The accurate replacement of these losses and correction of the chemical abnormalities is imperative when possible. Wangenstein² has shown that with decompression the distended bowel maintains its viability and function and the dangers of operation are reduced. Infection with or without an associated factor of toxemia is the commonest cause of death. With the advent of the antibiotics, it has been shown that³ the lethal effects of bacterial growth can be importantly diminished by treatment with streptomycin or massive doses of penicillin. Strangulation is the most serious complication of obstruction, resulting as it may in shock from blood loss into the involved part and in perforation with resulting peritonitis. Several of these important

therapeutic measures have been developed during the years included in this study and were not available to patients treated in the earlier period.

RESULTS

In table 1 are listed the causes of obstruction. It is not usual in statistical analyses of small bowel obstruction to include patients with primary cancers of the colon. We have included certain of them in this group since their presenting sign was acute small bowel distention. The mortality rate is high, 38.3 per cent, and has shown but slight improvement over the years (fig. 1), in spite of the advances in our knowledge just cited. A further evaluation of the causes of death is informative. These are listed in table 2 under thirteen categories. Peritonitis accounted for the greatest number of deaths. Fourteen patients in this group were not operated on. Four were admitted to other services where they were under treatment for other disease, the diagnosis of obstruction being made only at autopsy. Another 4 patients entered the hospital moribund and died before treatment could be instituted. The general condition of 3 patients never permitted operative relief for their obstruction, and in 3 other patients, because of known carcinomatosis, operative intervention was not advised. The latter entered the hospital for terminal nursing care. In the peritonitis group at least one third might have survived their disease had a diagnosis of obstruction been made earlier. We will refer again to the importance of early diagnosis. Thirty-three patients, or 43.4 per cent, of those dying had a strangulation type of obstruction at operation or necropsy. Eleven of these died as a result of overwhelming peritonitis resulting from strangulation. In 2 patients with massive intestinal infarction, extreme blood loss contributed greatly to rapid death.

Intestinal Anastomosis.—Intestinal anastomoses were carried out in 70 patients as part of the operative treatment, and death resulted from peritonitis in 8 of these patients because of leakage at the suture lines. In 1 patient generalized peritonitis was present at the time of operation. In 6 of those in whom leakage occurred a side to side type of approximation was used. One recognizes the dangers of failure in the union of loops of bowel sutured together at a time when one or both loops are the site of edema and inflammation. Frequently one must join these loops in spite of their structural defects, but we have questioned ourselves further concerning these failures. We can only speculate concerning the type of anastomosis employed in these fatal cases. It is a common and natural procedure to place the loops side by side and to make the opening between them at a position between the mesenteric and antimesenteric borders. Since the circulation of the bowel springs in a sharply segmental form from the mesenteric border to meet at the antimesenteric border, we suspect that in those cases of leak, in which the anastomosis was made near the mesenteric border, there may have been interruption of the terminal branches which led to necrosis of the bowel wall in the segment of the arc distal to the point of interruption.

This concept is affirmed by the observations of Cokkinis,⁴ who found by injection studies on human beings that collateral circulation in the small intestine stops with the terminal row of vascular arcades (fig. 2).

and that there are absolutely no anastomoses between the vasa recta of the mesentery or between the ramifying vessels on the small gut wall. In addition, anastomoses across the middle portion of the antimesenteric border of the gut are very few, since, after injection of laboratory specimens with india ink, this central longitudinal area was completely free of visible vessels.

Perforation and peritonitis resulted in death in 5 patients with simple obstructing lesions in the small intestine. In 4 of these operation was postponed in favor of a trial of further conservative management. We wish to emphasize the view that, since operation alone will eventually cure, it should be used at the earliest possible time compatible with the state of the complications.

Most of the remaining causes of death need little comment. One must emphasize the role that the wise employment of the antibiotics and of anticoagulants and an accurate administration of water, electrolytes and blood may play in hastening a favorable outcome. Massive hemorrhage from the colon might have been prevented or controlled in 1 patient, who died of this complication, had our knowledge and source of vitamin K been available at the time this patient was treated. Our present concept of the prevention of pulmonary embolism was not known when this happened. Pneumonia will be common in patients with severe distention. Wound infection secondary to contamination of the abdominal wall was commoner before the use of delayed closure and of antibiotics. High spinal anesthesia in a patient with unilateral pneumothorax for tuberculosis would seem today an obvious error. In short, one can state that in these very sick patients with obstruction and its complications every care is necessary in the use of any supportive or operative technic.

In 60 patients with primary cancer of the colon the outstanding clinical feature was distention of the small bowel, with vomiting and colic. Usually a scout roentgenogram of the abdomen should give more or less

obstructed small bowel by the Miller-Abbott⁵ tube, as advocated by Abbott and Johnston,⁶ has become common practice. Our experience coincides with that of others in that its successful passage results in relief of distention, vomiting and colic and a general improvement in the patient.

Small Intestinal Intubation.—Small intestinal intubation was attempted in 50 patients one or more times. Whenever intubation has been successful on one occasion, the tube has always been passed with ease in other trials. In 6 patients in whom attempts were made to pass the long tube, it functioned only as a means of gastric suction. Our failure cannot be charged against the use of this measure. Unsuccessful attempts to pass the long tube into the small intestine were made on 10 patients. In 7 of these the tube would not pass the pylorus; 2 patients did not tolerate the tube, and in 1 instance the tube would not pass the nares. Our rate of successful intubation was 68 per cent. In the hands of a skilled and devoted person with complete and enthusiastic assistance from the fluoroscopist, successful passage would be obtained in a much larger percentage of cases. In the occasional case with enormous distention in which quick passage of a long tube may be considered essential to recovery, one should consider the manual passage of the balloon through the pylorus into the jejunum by operative manipulation carried out with local anesthesia.⁷

Use of the Long Tube.—The complications associated with the use of the long tube are well known, but we wish to mention two serious complications that we have observed relative to its use. We have seen several patients in whom an efficient decompression of dilated small bowel gave the patient and his surgeon a sense of success. This was followed by perforation at the site of the primary lesion in the small bowel with the usual local reaction. In patients with mechanical obstruction successful decompression by the long tube should be considered a preliminary to operative treatment of the lesion. In 3 patients with obstructing lesions in the colon resulting in small bowel distention, decompression of the small bowel was successfully carried out with the Miller-Abbott tube but perforation happened in the colon despite the happy state of the small intestine. One was in the left colon at the site of neoplasm, one in the transverse colon and another through the appendix proximal to a cancer of the

definite information regarding the site of obstruction, whether it be colon, small bowel or both. Depending on the function of the ileocecal valve, obstruction in the colon may or may not result in distention of the small bowel with vomiting. If the valve resists pressure, the distention will be limited to the colon with threat of cecal perforation. If it is incompetent and small bowel distention and regurgitation results, it may be difficult to judge accurately the site of obstruction from the roentgenogram. Decompression of the

7. McIntyre, C. H.: Personal communication to the authors.

ascending colon. A closed loop was formed by the primary lesion and the ileocecal valve. One should emphasize that decompression from above by any type of tube does not usually decompress the colon and in any case of doubt as to the location of the lesion, if the colon is distended, an opening, cecostomy or colostomy, must be done in addition to the use of tube decompression of the small intestine. Cecostomy was used in the treatment of 35 of these patients in addition to tube decompression from above.

Enterostomy.—Enterostomy is now usually regarded as a procedure to be condemned and seldom utilized. Certainly if other methods of decompression are satisfactory, it should not be used. However, if a closed loop obstruction exists in the small bowel or if other measures fail, enterostomy may be the only decompressive measure available. In a small number of patients with long-standing obstruction from multiple obstructing points, it may be the treatment of choice. In justice to this procedure we mention its use on 15 patients. In 12 of them it functioned well and accomplished satisfactory decompression. None required operative closure. The incision in the abdominal wall through which the enterostomy is carried out is always infected. Ordinarily this is of small consequence, but in 2 patients the infection of the abdominal wall was serious and in 1 patient resulted in death. These complications occurred before the advent of antibiotics, and today the result might have been different.

IMPORTANCE OF EARLY DIAGNOSIS

It was clear to us on studying the cases briefly mentioned here that the earlier diagnosis of obstruction would result in better treatment and a lower mortality rate. The advances in the treatment of obstruction all relate to the management of features of the disease that develop late in its course. Early diagnosis depends entirely on proper evaluation of the history and physical examination. One must emphasize the supreme importance of a history of abdominal pain, its character and location. If the lesion is external, as in hernia, the

strangulation is exceedingly high. Shock from blood loss in the strangulated loop, tenderness, muscle spasm, a visible tender irreducible mass and leukocytosis all are suggestive of strangulation. Paracentesis in intra-abdominal strangulation will usually show bloody fluid after the process is four to six hours old. Generalized

Fig. 2.—Drawing showing that collateral circulation in the small intestine stops with the terminal row of vascular arcades.

colicky pain without localization of an inflammatory process indicates obstruction. Vomiting will eventually occur with small bowel obstruction; it may never be present with large bowel obstruction. One should not wait for the cardinal signs of ileus before advising operation. If the patient is seen early, operation should be carried out immediately. At this time distention, dehydration, shock and infection are not yet evident. We have overemphasized the correction of these late effects of obstruction which would never happen if early diagnosis and operative treatment were carried out. In the late phases of the disease one must correct them before operation can be done. If there is a suspicion of strangulation, operation should be carried out immediately. In addition to the history and a physical examination, one must mention a third important aid in early diagnosis of obstruction, the scout roentgenogram of the abdomen.⁸ The roentgenogram may make clear an early diagnosis of small bowel obstruction through depiction of the gas-filled loops; it frequently gives the location of the lesion and its probable nature and will indicate by the presence of free gas whether perforation has taken place from necrotic bowel due to strangulation. If it is not clear whether the obstruction is primary in the small or large bowel, it is permissible to give, with caution, a barium sulfate enema to determine the state of patency of the colon. When the disease is late in its course and a Miller-Abbott tube is in place near the obstructing point, the administration of a small amount of barium sulfate may aid one in determining more accurately the level and character of the obstructions.

COMMENT

It is not possible to refer to all of the errors and pitfalls noted in our diagnosis and management of patients with intestinal obstruction. It is apparent, however, from this study that the following deductions can be made:

1. Obstruction in the colon producing, in addition, small bowel obstruction carries the additional hazard of a "closed loop" colon obstruction. Its relief is not always possible with tube decompression. Cecostomy offers these patients decompression of the colon and supplements importantly decompression by tube from above.

Fig. 1.—Graph showing deaths for the years 1934-1947.

diagnosis is clear. If the lesion is not visible, the history of pain should lead one to suspect the diagnosis with enough certainty to warrant operation. The differential diagnosis between simple obstruction and obstruction with strangulation may be difficult, but it is important since the mortality rate from untreated

8. Wangenstein, O. H.: *Radiology* 17: 44-62, 1931. Solis-Cohen, L., and Levin, S.: *Radiology* 31: 8-14, 1938. Ochsner, A.: *Surg., Gynec. & Obst.* 56: 719-727, 1933.

2. The principal cause of death in these patients was peritonitis. The seriousness of this complication can be ameliorated to some degree by intensive antibiotic therapy. This is probably most important in patients with early peritonitis, particularly when intestinal resection and anastomosis are necessary. The prevention of serious or even fatal wound infections may be a function of the now routine use of chemical and antibiotic agents through the course of treatment.

3. Next to the difficulty of making a diagnosis of intestinal obstruction is the determination of whether or not there exists a state of strangulation. Operation should be carried out immediately when the suspicion of strangulation exists, but the dangers of error are lessened if the indications for conservative management of obstruction are strictly limited and defined. Conservative measures should be abandoned at once when:

(a) Progressive decompression of the small intestine is not satisfactory within thirty-six hours after commencement of effective suction. Operative manipulation of the tube may be considered.

(b) In the absence of a specific knowledge of the cause of the obstruction, temporary relief is attended by recurrence of the signs and symptoms of obstruction.

(c) The signs and symptoms suggest impairment of the bowel circulation or strangulation.

SUMMARY

The mortality rate for patients with mechanical obstruction of the small bowel is high. This is due largely to delay in diagnosis. The early diagnosis of the lesion can be made only by one's giving more attention to the history, physical examination and roentgen examination of patients with abdominal pain, nausea and vomiting. If a diagnosis is made at this time, operation should be performed. If the patient is seen later, when distention, dehydration and infection have supervened as a late stage of the disease, these complications must be combated in preparation for operation. Cure can be effected only by operative correction of the mechanical obstructing factor. Advances in our management of the complications of obstruction have tended to obscure this fact, and a reemphasis on the fundamentals of the clinical aspects of early recognition and prompt operative therapy will importantly and favorably affect the treatment of obstruction of the small bowel.

ABSTRACT OF DISCUSSION

DR. R. J. NOER, Detroit: The reported mortality rate is higher than in most series, but this paper included only patients subjected to operation or who came to autopsy. There must have been many cases in which there was decompression by suction drainage or other means, and thus the patients recovered without operative procedure. Had these been included the mortality rate would have been lower. A few diagnostic points should be emphasized. At the Detroit Receiving Hospital, where we see much intestinal obstruction, we are impressed with the length of time the patient will suffer before seeking medical aid and with the number of physicians who fail to recognize the early signs and symptoms of intestinal obstruction. It should be emphasized that the so-called fecal vomiting is not essential to a diagnosis of intestinal obstruction. The reflex vomiting which occurs early before intestinal content reaches the stomach is just as important a sign of an obstructed intestine and will be more helpful in an early diagnosis. Constipation and obstipation are not at all essential to a diagnosis of intestinal obstruction. Many patients have bowel movements and even diarrhea in the presence of obstruction. To understand this one need only remember that the intestinal tract distal to an obstruction can still discharge its contents

through the anus. A final diagnostic shortcoming is the failure of many persons to obtain scout roentgenograms of the abdomen. The importance of this has been emphasized by Wangenstein and others. Dr. Johnston has repeatedly said that the scout roentgenogram of the abdomen is the single laboratory technic of value in the diagnosis of intestinal obstruction. I do not agree with the authors' suggestion that operative enterostomy is a procedure to be used with any frequency. The most effective enterostomy is that carried out through the nose by means of a balloon-tipped intestinal tube. It should be emphasized, however, that the mere dropping of a tube into the patient's stomach is not adequate decompression. The tube must either be passed into the intestine or at least function as a duodenal suction tube if the patient is to be relieved of his distention.

DR. CLARENCE DENNIS, Minneapolis: I wish to express Dr. Wangenstein's regrets that he has been unable to be here. Dr. Buxton and Dr. Collier have courageously included in their statistics deaths from abdominal carcinomatosis in which small bowel obstruction has been only a factor. The figures my colleague and I have published specifically omit such cases. Several years ago it was my privilege to experiment in the laboratory on the safety of various types of anastomosis in the presence of previously established intestinal obstruction. Relief by side to side anastomosis was attended by a high mortality rate, an experience parallel to that of Owings and Smith at Johns Hopkins Hospital in the early 1930's. End to end oblique anastomosis was attended by no deaths, even in the absence of antibiotics, except in 1 case in which an obvious technical error had been made. Approximately 50 end to end anastomoses have been done in the relief of clinical obstruction. One suture line has leaked, and in that case gross peritoneal soiling occurred prior to laparotomy. With slight modification of the Wangenstein aseptic decompression method, it has been my personal experience that the bowel may be emptied without contamination at operation. As Wangenstein pointed out, the emptying of the bowel makes safe a direct attack on the obstructing mechanism, with resection and anastomosis if needed. Most of the patients have been sent home in less than two weeks, relieved and without need for further operation. There has been no spillage or catastrophe arising from the use of this method in the cases (about 20) with which I have had personal experience. This seems far safer and more practical than catheter enterostomy. My co-workers and I feel that the surgeon who treats a patient with ileac obstruction conservatively is shouldering a greater responsibility than he would if immediate operation were to be employed, although it is true that the proper selection of cases for this method does yield a lower over-all mortality rate. This seeming paradox arises from the necessity that the abdomen be examined at least every four hours and that roentgenograms must be made frequently if the conservative course is to be followed. Moreover, the surgeon must hold himself in constant readiness for exploration if signs of strangulation should appear.

DR. FREDERICK A. COLLIER: We will all admit the importance of antibiotic chemotherapy, the maintenance of nutrition, water and electrolytic balance and decompression, but I am glad that all the essayists this morning have emphasized the importance of early diagnosis. There is no substitute for this. As an example of this, let me recite some analyses we have made recently in over 400 patients treated in our hospital for carcinoma of the colon. The study was made originally to find out whether certain technics we had been using were justified. We found that, of all of these patients, 40 per cent were beyond hope of surgical cure when we saw them. The mortality rate in the surgical treatment of those patients in whom the surgeon had a chance—that is, in whom the lesion was localized to the gut or to the adjacent lymph nodes—was very low, a little over 1 per cent. The mortality rate, however, for the disease itself in that other 40 per cent was high, and it seemed to us that we had been studying the wrong thing. That is, why fuss about whether one should do an open anastomosis or a closed anastomosis when the net result in favorable cases will give a mortality result of between 1 and 2 per cent. In the group of cases of small bowel mechanical obstruction which we presented this morning, we felt that it was only right in

studying the whole problem to present all of the patients we had seen, not the patients we had operated on but all we had seen. A considerable number of them were dying when we saw them. I am pleased that the importance of early diagnosis of acute abdominal lesions has been emphasized, since certainly that is most important. Many of us do not diagnose lesions of mechanical obstruction as well as we did twenty-five years ago. The knowledge that we have of methods for decompression and for the correction of dehydration, and of penicillin and streptomycin therapy with which to combat infection, retards diagnosis. I am very glad that Dr. Dennis and Dr. Noer emphasized the danger of conservative management. If there is mechanical obstruction in the small bowel, the ideal time to operate on the patient is before dehydration, before distention and before infection occur. The advice given by the surgeons of decades ago was that one should operate on diagnosis if complications do not exist. That is the optimal time to cure mechanical obstruction. Again, even though decompression is accomplished, it is much better, if the mechanical obstruction exists, to carry out operative correction of the mechanical defect as soon as the patient is in condition to withstand operation. I feel that, when one is in doubt concerning the patient seen early with generalized colicky pain, nausea and vomiting, even though one cannot make out the exact location of the obstruction, one should advise operation.

AN EVALUATION OF THERAPY IN INFANTILE ECZEMA

LEWIS WEBB HILL, M.D.
Boston

In 1922 I wrote that with painstaking and intelligent care most cases of infantile eczema can be cured entirely. In 1934 I said that the treatment of eczema may be summarized in six words: "Find the cause and remove it." These statements were due to the optimism of youth. The condition in many cases cannot be cured entirely, and finding the cause does not happen as often as the books tell us.

In 1948 I say, "Infantile eczema is a perplexing and exasperating disease to treat, and I wish I understood it better."

When one is treating an infant with eczema one is dealing with a patient who is diligently and ingeniously working against him twenty-four hours a day; no skin can heal when it is continually rubbed and scratched. Another difficulty is that atopic dermatitis, which comprises about 75 per cent of "eczema" in the young, has as its basis an abnormality of constitution which cannot be changed.

Under the heading "infantile eczema" are included a number of different dermatoses. It is of the utmost importance to be able to determine into which group the eruption falls. It may be atopic, contact or seborrheic dermatitis, nummular eczema, an eczematized fungous infection or a low grade pyogenic infection. It may have nothing to do with allergy.

I suspect that many allergists do not pay enough attention to dermatology. It is as important for an allergist to be a reasonably competent dermatologist as it is for him to be an internist: he is continually dealing with the skin. A careful study of the morphologic aspects of the eruption, its distribution, the primary elements which compose it, the history, its gradual or sudden appearance, and particularly the part of the

body on which it first appeared, is essential to a correct diagnosis. I shall discuss only the two eczematous dermatoses which rest on an allergic basis: atopic and contact dermatitis.

USE OF CUTANEOUS TESTS

It is clear that many cases of infantile eczema develop on an atopic soil—that is, the infants give positive cutaneous reactions of the urticarial type and they and their parents frequently have asthma or hay fever. The tendency that their skins have in early life to eczema is a phase in the natural history of their allergic development and usually lasts about two years, but may, of course, last indefinitely. It was thought, when cutaneous tests were introduced, that they would solve the problem of infantile eczema. Unfortunately, there is more to it than this—the significance of cutaneous tests is not entirely understood, and, indeed, it has been said by some very competent and thoughtful allergists that the urticarial type of reaction to a cutaneous test has nothing to do with infantile eczema. This is surely often so; but I cannot agree that it is always so, because in my experience eczema can sometimes be relieved or even cured by removal from the diet or environment of allergens which give urticarial type reactions and made to recur with reexposure. This is the only valid proof of causation; the cutaneous reaction, particularly to tests with foods, means nothing by itself, except that at some time antigenic food protein has entered the circulation and an immunologic reaction has resulted. It is as natural a phenomenon for an atopic person to have positive reactions to cutaneous tests with foods as it is for a fish to have scales—it is part of his makeup. That is the way he reacts to absorbed food protein; it is a mark of his constitution, but comparatively few of these reactions have anything to do with his allergic symptoms.

"Tolerance" is mentioned a good deal, but not much is said about why there is clinical tolerance to a food in the presence of a positive reaction to a cutaneous test. The most reasonable explanation seems to me to be that the allergen when ingested does not reach the sensitized tissue, whether it be skin or bronchial mucous membrane, in sufficient amount to produce a reaction. I strongly suspect that in human allergy, as well as in animal anaphylaxis, the sensitizing dose of an antigen is much less than that required to produce a shock reaction in the sensitized tissue and that this may be why so many positive cutaneous reactions to foods are of no clinical importance. It has taken only an infinitesimal amount of absorbed food protein to produce cutaneous sensitization—it often takes more to produce a reaction in the sensitized tissue, and not enough is absorbed to do it. If the tissue sensitization is of very high degree, however, a reaction results from the absorption of only a very small amount of antigen, such as is commonly absorbed; if the tissue sensitization is not of high degree more antigen is required than is ever absorbed, and hence no reaction results. There is experimental evidence to support this conception, but it would take too long to discuss in a paper of this sort.

Some strange things are done in allergy. I have seen a 5 year old child who had been tested with 236 foods and had been found allergic to 109 of them. Her mother proudly presented a list of the 109 foods which did her harm, typed in red, and a list of the 127 which she could eat, typed in black.

Included among those which she must not eat were squab, calves' brain, venison, caviar, poppy seed, bay leaves, thyme, red currant and *sanka*[®] coffee. She was fortunately found not to be allergic to pheasant, turtle, artichoke, garlic, horse radish, tripe or caraway seed.

Another child of about the same age appeared one day with a little box of extracts in graduated dilutions obtained by her doctor from one of the large pharmaceutical houses in accordance with the skin tests he had made. The mother was giving an injection of this extract every day. On the bottom of the box was typed a list of the antigens the extract contained. This read as follows: beef, yeast, lactalbumin, lettuce, onion, broccoli, cat hair, dust, hazelnut, pecan, peach, fig, garlic, cattle hair, cotton seed and mixed feathers. Too much of this sort of thing goes on.

Infants with atopic dermatitis almost always give positive reactions to scratch tests with one or more foods. The commonest are egg, milk and wheat. Inasmuch as they eat no egg, egg has nothing to do directly in the causation of the eczema. In infants, pronounced positive reactions to scratch tests with milk and with wheat are usually indicative of causation; positive reactions to some of the other foods may or may not be. The only way to determine what foods are of importance is to remove them from the diet and see what happens, provided that there are not too many of them. If so many foods are involved that an adequate diet is not left, only those should be removed which elicit the greatest reactions, and no eczematous baby should ever have an inadequate diet no matter what his cutaneous reactions are.

REACTIONS TO MILK

Milk is of considerable importance. In most cases substitution of goat's milk for cow's milk is not of value, because there are so many crossed reactions between cow and goat lactalbumin. Of 44 eczematous infants who reacted to cow lactalbumin, 25 gave identical reactions to goat lactalbumin. It is a curious fact, however, that while goat's milk is rarely of value in infantile eczema, it is practically always tolerated by infants, usually without eczema, who have violent symptoms from even a few drops of cow's milk. Many of these patients, in spite of extreme clinical sensitivity, give negative reactions to cutaneous tests with milk, and I suspect that their immunology may be somewhat different from that in infantile eczema. It is better in eczema, if sensitivity to milk exists, to use a milk-free food, of which *sobee*[®], mull soy[®] and *nutramigen*[®] are the most popular. These foods have a real but limited place in the treatment of infantile eczema, but are being grossly misused. The doctor sees a rash on the baby, which may be of almost any origin, and immediately prescribes a milk-free food. These should be used only when there is a positive cutaneous reaction to a test with milk.

DIFFICULTIES IN DIAGNOSIS

I think that it is fair to say that manipulation of the diet in accordance with the results of skin tests often does good. This is not very consistent, however, and there are plenty of cases in which it seems to make little difference what the diet is, in spite of positive reactions to various foods. The plain truth is that there is at present no really satisfactory treatment for

the disease atopic dermatitis in the infant, child or adult—and it is a disease, as much as pernicious anemia is a disease. Many cases of infantile eczema have nothing to do with the diet. I repeat this and say again that many cases of infantile eczema have nothing to do with the diet, for the idea is firmly implanted in the minds of most of those who deal with infants that almost any cutaneous eruption arises from food. Infants have contact dermatitis, just as adults do, and it is not uncommon. If the dermatitis begins rather suddenly after the age of 6 months, particularly if it begins on the trunk or extremities, there is a rather good chance that it may be contact dermatitis. I have seen this in infants from the sizing in a new unlaundered undershirt, from the dye in a pink sweater, from medicated baby oil, from *aristol*[®] powder (thymol iodide), from hypochlorite bleaching powder, from the rubber waist band of a patent diaper and from furniture polish. The location of the initial dermatitis may furnish the clue to the cause, but it must be remembered that contact dermatitis may spread far from the original contact. In many cases, although one can be sure that the eruption is of the contact variety, it is not possible to determine the exact cause. Patch tests may occasionally be of value: more often not. In contact dermatitis, even though the exact cause is not found, one may likely obtain good therapeutic results by allowing nothing to come in contact with the skin except clean white cotton and whatever local medication is used.

Atopic dermatitis is a disease; contact dermatitis is an episode.

The dermatologist, in all cutaneous conditions, is immensely concerned with local treatment: the allergist as a rule does not pay enough attention to it. It must be realized that the immunologic approach to infantile eczema is far from perfect and that skilled local treatment often does more good than an immunologic approach. The two fundamental necessities are to use the right kind of salve or lotion for the right kind of dermatitis and to protect the involved areas from any and all trauma in so far as is possible. About half of what one sees on the skin in infantile eczema is what the infant does to himself. Results of local treatment on the arms and legs are almost always satisfactory, because they can be bandaged. A piece of soft cotton cloth is applied over whatever ointment is being used, then a 2 inch (5 cm.) *ace*[®] bandage. This efficiently protects the skin: it is too thick to scratch through. This is a simple measure, but may do more good to your patient than anything else.

I know of no really good way to stop itching; there are disadvantages to all the usual antipruritics, and *tripelennamine hydrochloride* (*pyribenzamine*[®]) and *diphenhydramine hydrochloride* (*benadryl*[®]) given internally have in my hands been useless. I have not as yet had enough experience with the use of *pyribenzamine*[®] ointment locally, as suggested by Dr. Feinberg, to say anything about it that would be valid.

There have been numerous other special treatments recommended for infantile eczema, which have proved of little or no value. A possible exception to this is the ingestion of unsaturated fatty acids in the form of linseed oil, corn oil or lard, as originally recommended by Hansen.¹ Although this treatment has been in use for fourteen years, there is still no unanimity of opinion

1. Hansen, E.: Possible Mechanism of Crude Coal Tar Therapy in Infantile Eczema, *Proc. Soc. Exper. Biol. & Med.* **31**: 161 (Nov.) 1933.

concerning it. Hansen² and his co-workers in 1947, however, reported a large and very carefully studied series of cases and stated that they were convinced that unsaturated fatty acid therapy is a very useful adjunct to treatment. This treatment can do no possible harm to the child, which is more than can be said of some treatments that have been recommended, and, moreover, its proponents (Hansen, McQuarrie and Stoesser) are sound and conservative pediatricians of the highest reputation. I cannot honestly say that I have myself seen it do much, but perhaps I became too easily discouraged with it and did not give it a fair trial. It should be used by everyone in the treatment of infantile eczema, and in the course of time opinion concerning it will be crystallized, for a new treatment of any disease, in order to become finally standard, must be efficacious in the hands of every one as well as in the hands of its originators.

SUMMARY

I wish especially to emphasize four things: (1) the need for a common sense point of view concerning cutaneous tests with foods, (2) the need for more attention by allergists to local treatment, (3) the necessity of protecting the skin from external trauma and (4) the fact that not all eczema in infants has to do with the diet and that contact dermatitis is not uncommon.

319 Longwood Avenue.

ABSTRACT OF DISCUSSION

DR. A. V. STOESSER, Minneapolis: Dr. Hill may have forgotten that he also published a good paper in 1933 in the *Journal of Pediatrics*. We, at Minnesota, read this article and set up a program to take care of the patients with infantile eczema coming to the University Hospital. At first, we were very happy with our results, but, as the number of cases increased, some things being done did not work out so well. We followed Dr. Hill's recommendation closely, although we were discouraged at times. Now I find that he has adopted a broader point of view. In other words, as a teacher he is beginning to see that there are a number of things one can do for eczema and that emphasis should not be placed on any one thing. The practitioner should not get into the habit of thinking of a certain food in the diet as the only cause of infantile eczema or of believing that contact with something is the cause of the disease. Over and over again, the emphasis has been placed on only one phase of therapy. The diet may or may not play a part. Secondly, contact is significant. When the child begins to walk, he may have dermatitis on his arms and legs. This may be from the living room rug or the overstuffed furniture. The avoidance of these contacts will sometimes terminate the eczema in a short period. Thirdly, there is the matter of medication. There is always the desire to grease the children, put oil on them and use ointments. Why not water? Why not hypoallergic soaps and creams? They give comfort to infants. Fourth, sedation is important. Dr. Hill does not think much of the antihistaminic drugs. I do, but not for their specific action. They are good sedatives and the best is still diphenhydramine hydrochloride (benadryl®). Finally, there is the question of adjuncts. Physicians come to us and say that they have taken good care of children by using thyroid extract. The same applies to the unsaturated fatty acids. Dr. Hill mentioned that he did not know whether this type of therapy would work out in many cases. The missing link in this treatment is the determination of the blood lipids, a difficult procedure. If the physician had that information he could do better with those infants who required the unsaturated fatty acids.

THE TREATMENT OF THYROTOXICOSIS

I. S. RAVDIN, M.D.

EDWARD ROSE, M.D.

and

JAMES D. MAXWELL, M.D.

Philadelphia

Within the past few years a number of important advances have been made in our knowledge of the normal and abnormal functioning of the thyroid gland. These advances have resulted in part from the introduction of new methods for the treatment of thyrotoxicosis. It would seem desirable at this time to reexamine the present methods of treating thyrotoxicosis with special consideration of the status of thyroidectomy.

The most important recent advances in the knowledge of thyroid physiology have resulted from the use of three major tools: (1) a large group of goitrogenic compounds, varying considerably in chemical structure and mode of action (sulfonamide compounds, thiourea derivatives, sulfocyanates); (2) radioactive iodine and (3) relatively purified preparations of the thyrotropic hormone of the anterior pituitary. From the integrated use of these tools much has been learned concerning the mode of transport of inorganic iodine to the thyroid; the mechanism of its entrapment, fixation and subsequent incorporation into the thyroid hormone; the mechanism of the release of the thyroid hormone into the circulation; the effect on this release of a variety of extrathyroidal factors, and the control exercised by the anterior pituitary on these various functions. There remains much, however, of which we are still ignorant. We do not know, for example, the structure of the thyroid hormone, nor do we know the site or mode of action responsible for its specific metabolic effect on the target tissue cell. Knowledge of the etiologic aspects of simple nontoxic diffuse goiter is probably still incomplete. Finally, we are still ignorant concerning the primary cause of thyrotoxicosis.

With the possible exception of the true toxic adenoma, it seems probable that the primary cause of thyrotoxicosis lies outside the thyroid gland itself. Certain clinical evidence suggests the possible etiologic importance of functional disturbances in the higher psychic centers, the hypothalamus, the anterior pituitary, the autonomic nervous system, the gonads and the adrenals. Proof of such relationship, however, is still lacking. The thyrotoxic state might be considered theoretically to be therapeutically vulnerable at three possible levels: (1) by an attack on the initiating factors, (2) at the thyroid itself or (3) at the level of the peripheral target tissue cell where the impact of the excessive output of thyroid hormone is exerted. We have no methods of attack at the causative level, with two or three possible exceptions: psychotherapy, irradiation of the anterior pituitary and excision of true toxic adenomas. Likewise, we are unable to counteract the peripheral tissue cell effect of the thyroid hormone. The principal approach at present, therefore, remains at the thyroid level. Present methods of treatment of thyrotoxicosis have a common objective: a reduction in the output of thyroid hormone of such magnitude and duration as to produce a permanent

Read before the Section on Surgery at the Ninety-Seventh Annual Session of the American Medical Association, Chicago, June 24, 1948.

remission in the objective and subjective manifestations of the disease.

Those methods of treatment which require consideration may be listed as follows: (1) iodine therapy, (2) treatment with goitrogenic compounds, (3) external irradiation of the thyroid or pituitary, (4) radioactive iodine therapy and (5) radical resection of the thyroid gland.

IODINE

Iodine in any absorbable form will produce a variable degree of remission in at least 95 per cent of thyrotoxic patients. Its exact mode of action in accomplishing the remission is as yet largely obscure. Since such remissions are usually incomplete, the usefulness of iodine is limited largely to situations in which only a short remission is desired, i. e., in preparation for thyroidectomy. In the Endocrine Clinic of the Hospital of the University of Pennsylvania we have observed a small group of patients in whom the response to iodine was unusually prompt and complete, the basal metabolic rate often falling to subnormal levels within a few days. In this group the severity of the disease is usually mild to very moderate, and some of the patients exhibit evidence of the hyperophthalmopathic type of Graves' disease.¹ Even then the response is difficult to predict. The remissions so induced may be prolonged or permanent, but the group of patients responding thus to iodine is small, not more than 5 per cent of all patients with thyrotoxicosis. These patients frequently have a major psychogenic initiating or contributory factor. The motive force having been removed or brought under control, the symptoms of hyperthyroidism may be decidedly reduced or disappear altogether. The use of iodine should, in general, be limited to (1) preoperative preparation, (2) treatment of the "thyroid storm," (3) temporary postoperative administration, (4) occasionally as a therapeutic test when the diagnosis of thyrotoxicosis is in doubt and (5) certain cases of hyperophthalmopathic Graves' disease.

GOITROGENIC COMPOUNDS

The goitrogenic compounds now being used produce a remission in the thyrotoxic state by inhibiting the synthesis of thyroid hormone. They do not affect the thyroid hormone already active in the body. Although their administration alleviates the symptoms of toxicity, the glands of patients receiving these drugs remain hyperplastic and show the typical histologic features found in untreated thyrotoxic patients. More than a score of goitrogenic substances have received clinical trial. While several (6-methyl thiouracil, thiourea²) are currently employed in certain clinics, 6-propyl-2-thiouracil³ is the most widely used. The consistency and rapidity with which this drug produces remissions vary widely and may be influenced by the type of goiter and by previous treatment. Thus, patients with large or nodular goiters or those recently treated with iodine may be slow to respond. Some patients are partially or completely refractory without apparent reason. We have seen this in approximately 5 per cent of our patients.⁴ The earlier hopes that these

compounds might prove to be highly satisfactory agents for the permanent relief of thyrotoxicosis have not been fully realized. The present consensus indicates that sustained remissions following prolonged therapy (six to twelve months) cannot be expected in more than about 50 per cent of cases.⁵ Our experience suggests that the majority of patients showing a sustained remission and a return to normal activities have exhibited the milder forms of thyrotoxicosis, with minimal goiter, slight to moderate elevation of basal metabolic rate and no cardiac or other visceral complications. Prolonged treatment with propylthiouracil, with the hope of producing a permanent remission, may be considered justifiable in such mild forms of thyrotoxicosis, as well as in children with toxic diffuse goiter of mild to moderate severity. Compounds of this type have also been administered prior to the use of radioactive iodine.⁶

These goitrogenic substances have proved useful in the prolonged control of certain thyrotoxic patients in whom thyroidectomy cannot, for various reasons, be undertaken even though theoretically the treatment of choice. This group includes certain older patients, those who refuse operation and those who cannot be brought by medical therapy to a point where operation can be considered justifiably safe. Admittedly they are few in number. We have in the past five years treated 15 patients of this type with maintenance doses of thiouracil, or propylthiouracil, for periods ranging from six to forty-eight months with satisfactory results, even though we cannot anticipate a sustained remission should treatment be withdrawn.

Although most patients can be satisfactorily prepared for thyroidectomy by the use of iodine, it has proved inadequate in two important groups of cases: (1) certain severely toxic patients in whom iodine alone fails to produce a satisfactory preoperative remission and (2) patients rendered "iodine-fast" by the prolonged use of this substance. In such patients a complete remission can usually be produced by the prolonged use of goitrogenic agents. Operative morbidity and mortality are thereby reduced. Thiouracil compounds have also been employed in the treatment of thyroid crisis⁷ and in conjunction with tracer doses of radioactive iodine for diagnosis in doubtful cases.⁸

The most recent report on the use of goitrogenic compounds and iodine in the treatment of thyrotoxicosis is that of Danowski and his co-workers.² They treated 118 patients with thiourea and strong solution of iodine over a long period. Of these, 3 died during the course of treatment. They stated, "The additive effects of thiourea and iodine solution have been amply demonstrated in control studies and may be attributed to the capacity of the iodine to act directly on the thyroid gland, inducing a resting phase, and at the same time blocking thyrotropic hormone which increases thyroid activity." The mortality rate in the series must be considered as

2.5 per cent if it is to be compared with the mortality rate in the 655 cases we are reporting following thyroidectomy.

EXTERNAL IRRADIATION OF THE THYROID OR PITUITARY

External irradiation of the thyroid, long the subject of controversy, has been largely abandoned since the introduction of goitrogenic compounds and radioactive iodine. Irradiation of the pituitary has received a limited trial.⁹ Its usefulness at present would appear to be restricted to certain patients with the hyperophthalmopathic syndrome of toxic diffuse goiter (Graves' disease).¹⁰ In these patients thyrotoxic phenomena are frequently mild and may be at times entirely absent or replaced by evidence of hypothyroidism. Ocular signs and symptoms dominate the clinical picture and may include varying degrees of proptosis, periorbital and palpebral edema and pigmentation, edema and congestion of the conjunctiva, keratitis, lacrimation and swelling of the lacrimal glands, fixation of the eyeball, pseudohypertrophy of the extraocular muscles, papilledema or optic neuritis, and edema or infiltration of the orbital tissues. This ophthalmopathic syndrome occasionally develops rapidly and unexpectedly after thyroidectomy in patients with minimal preoperative ocular signs, but its presence can usually be suspected by one or more of the aforementioned manifestations. Too great a suppression of thyroid function in such cases, whether by thyroidectomy or any other means, may be followed by disastrous progression of the ocular changes. The pathogenic mechanism of these changes is still obscure, but some kind of abnormal effect is believed to be exerted by the anterior pituitary on the extraocular muscles and the orbital tissues. Suppression of thyroid function appears to aggravate the ocular disturbance by removing an inhibitory effect on the anterior pituitary. In the presence of pronounced ocular symptoms and a mild thyrotoxic state, thyroidectomy is, in our opinion, contraindicated. Therapy should be aimed at inhibition of anterior pituitary activity and has included such measures as desiccated thyroid, estrogenic substances and the intermittent use of iodine. Irradiation of the pituitary, while far from being precisely controllable in its placement, or in the exact amount delivered to the pituitary, nevertheless appears justifiable in severely progressive cases. We have employed it, along with other measures, in 10 patients of this type without obviously harmful effect. In none of these patients was there continued progression of the ocular syndrome, which remained unchanged in 6 and showed varying degrees of regression in 4 instances. Improvement in the latter cannot, of course, be attributed with certainty to the irradiation in view of the other measures employed and the possibility of spontaneous remission.

RADIOACTIVE IODINE

Although radioactive iodine was used in the treatment of thyrotoxicosis as early as 1941, the first detailed reports concerning it did not appear until five years later.¹¹ The larger experience with it has been acquired during the past three or four years. The number of patients treated is still comparatively small, and the

time available for follow-up has been limited. These restrictions prevent adequate evaluation of this substance at present. While it must be regarded as a promising new tool in the treatment of thyrotoxicosis, much greater experience will be required before its usefulness can be finally determined.

Its use has been limited chiefly to selected cases, most of them of either toxic diffuse goiter (Graves' disease) or recurrent postoperative thyrotoxicosis. Few patients with toxic nodular goiter appear to have been treated. The radioactive isotope I^{131} with a half-life of eight days, administered orally, with or without a small carrier dose of stable iodine, is now most generally employed. Total dosage and frequency of administration have varied widely in different clinics. The preparation, transportation, handling and administration of the material require specially trained personnel, rather elaborate safety precautions and moderately expensive physical equipment. Its effective use is therefore limited at present to a relatively few clinics.

The toxic thyroid will usually take up at least 40 per cent of an oral dose of radioactive iodine if its avidity for iodine has not been impaired by recent therapy. Internal irradiation by the gamma rays then results in a gradual reduction of the activity of the toxic thyroid, although this may be preceded by a temporary exacerbation of the disease. Remission may be complete in from one week to six months or longer. The incidence of satisfactory end results appears at present to be somewhere between 70 and 80 per cent, but it should be remembered that most of the reported series have consisted of selected cases. Myxedema with fibrosis of the thyroid may occur, and the ocular complications are occasionally aggravated. Radiation tracheitis and esophagitis may occur. Late carcinogenic effect on the thyroid and damage to the urinary tract during excretion are possible dangers which cannot at present be evaluated. These possibilities should not be underestimated.

THYROIDECTOMY

Principles of Preoperative Care.—The basic principles of preoperative care of patients with hyperthyroidism are the same, regardless of the type of the disease. The patient should be placed on a program which will tend to: (1) bring the basal metabolic rate to normal, (2) improve the general nutrition as demonstrated by a gain in weight and an improvement in the general physical condition, (3) lead to a stabilization of the pulse rate and (4) finally, but not the least important, restore the patient's confidence in ultimate recovery.

Reduction of the Metabolic Rate: Because the administration of propylthiouracil alone results in a very soft, friable and highly vascular gland, which makes operation more difficult and postoperative oozing more frequent, we have during the past three years used it in conjunction with iodine in preparing the thyrotoxic patient for operation. In the severely toxic patient propylthiouracil is administered in amounts varying from 150 to 300 mg. per day, until the metabolic rate begins to approach normal. Ten days to two weeks before operation is planned, treatment with iodine is begun in the form of potassium iodide (10 drops of a saturated solution, three times a day). The metabolic rate is thus brought to normal or to within safe limits, the major symptoms of the disease are brought under control and the gland at operation is relatively avascular, firm and easy to excise and to suture.

M., and Evans, R. D.: Treatment of Hyperthyroidism with Radioactive Iodine, *J. A. M. A.* 131: 86-91 (May 11) 1946.

Nutrition: Thyrotoxicosis of any type results in an increase in metabolism. As long as food intake exceeds energy requirements, weight loss does not take place. Sooner or later, as the result of a number of factors, the patients lose weight. As the complex nutritional deficiency, from which many of these patients suffer, becomes severe, the symptoms of hyperthyroidism may become exaggerated.

During the preoperative period the patient's nutritional program therefore receives the most careful supervision. Thiamine hydrochloride in amounts of 50 to 200 mg. daily is given in addition to riboflavin, 45.0 mg., and nicotinamide, 75.0 mg., daily. We also find it useful to give additional vitamin B in the form of a potent yeast concentrate. As the vitamin B deficiency is overcome and as the metabolic rate declines, appetite usually returns and the weight increases.

A highly nutritious diet is provided, consisting of 3,000 to 5,000 calories a day. Provided that the protein is a complete protein and adequate in amount, 25 to 35 per cent of the total calories consumed, there is every reason to expect¹² that any existing fatty infiltration at the time of initiation of the dietary program will resolve itself and thus provide a liver less susceptible to the assault of anesthesia and operation. Interval feedings or even tube feedings may be necessary.

The important thing is that the patient eat an amount sufficient to meet energy requirements and have left a modicum for restoration of the depleted body tissues. The criteria of achievement of this objective are a gain in body weight in the absence of edema and an improvement in general muscular tone. The myasthenia frequently seen in thyrotoxicosis may result from two factors—the muscular wasting of hypermetabolism and that associated with the nutritional deficiency per se.

We are convinced that an over-all improvement in the nutritional state is one of the most important objectives of the period of preparation for operation.

Stabilization of the Pulse Rate: Numerous authors have called attention to the desirability of achieving cardiovascular stability prior to operation. Even though the rate may remain above normal, a diurnal uniformity of rate is desirable and should be regarded as one of the major objectives of the preoperative preparation. It usually occurs along with a reduction of the metabolic rate and with improvement in the nutritional state of the patient.

It is facilitated by mild sedation during the preoperative period and by optimal hospital environment. A nervous frightened patient presents an increased operative risk.

Psychiatric Therapy: The collaboration of a psychiatrist is usually unnecessary in the preoperative preparation of these patients. The surgical staff should assist in this phase of therapy. The staff must be thoroughly conscious of the psychogenic factors that played a part in the initiation or extension of the disease and of the fears that beset these patients. They must attempt to emulate the approach of the psychiatrist. Here again the medical, surgical and nursing staff play an important part in restoring the patient to an emotional state which makes operation safer and the postoperative persistence or recurrence of symptoms less likely.

Anesthesia and Operation.—When the objectives of the preoperative period have been achieved, the operation should be done. In the patients who were severely toxic when first seen and in those who are still easily frightened we employ the method of "stealing the thyroid," the efficacy of which was early advocated by the late George W. Crile. On the morning of operation the house officer who has most actively participated in the care of the patient administers thiopental sodium (pentothal[®] sodium) intravenously. The patient, thinking that only another test is being made, goes to sleep unaware that within a few moments the operation will proceed. The attendant fear and psychic shock of anesthesia and operation is overcome.

Inhalation anesthesia is then administered. The specific anesthetic employed is less important than the prevention of anoxia. Some anesthetic agents, such as cyclopropane, may affect cardiac activity; others, such as ether or ethylene, may affect the liver, but these risks may be accepted as long as anoxia is avoided. Under conditions of anoxia, cardiac integrity may suffer, liver injury become further accentuated and a preexisting renal injury become worse.

To facilitate the anesthetist's control of the situation, tracheal intubation may be done prior to operation. It is a valuable safeguard often overlooked. Perfect anesthesia and a competent airway often are as important as the technical aspects of the operation.

Every possible care must be exercised not to injure the recurrent laryngeal nerves. The suggestion of Lahey¹³ that the recurrent laryngeal nerves be exposed at every thyroidectomy will, if carefully followed, reduce the number of injuries. While we do not do this routinely, we do it often enough to feel sure that this procedure is a valuable addition to the technique of thyroid surgery. Even exposure does not prevent injury unless constant care is exercised throughout the operation. The injudicious application of a hemostat into a pool of blood or the passage of a suture into the tracheothyroid space may result in temporary or permanent injury in spite of previous visualization.

No thyroid resection should be attempted without prior identification of parathyroid tissue. These glands vary in number and in position even in normal persons. Their location may be further distorted by enlargement of the thyroid.

The thyroid isthmus should be divided and the trachea exposed. Although a tracheotomy is seldom necessary, it may occasionally be required as the result of tracheal collapse. Furthermore, sparing the isthmus and pyramidal lobe results in a higher incidence of persistence of hyperthyroidism. A radical resection of both lobes of the thyroid should be accomplished in every instance if a high incidence of permanent cures is to be expected. It is far better to remove too much than too little, for the hypothyroid state, which may follow a very radical thyroidectomy is far better and more easy of control than is persistent hyperthyroidism.

Even in the adenomatous goiter with hyperthyroidism and in instances of apathetic hyperthyroidism, maximal subtotal thyroidectomy is preferable. It is rarely necessary now that the operation be done in stages.

There are several technical factors which must be considered during the operation. They can be summarized as follows. The gland should be adequately exposed, if necessary, by division of the prethyroid

12. Goldschmidt, S.; Vars, H. M., and Ravdin, I. S.: The Influence of the Foodstuffs upon the Susceptibility of the Liver to Injury by Chloroform and the Probable Mechanism of Their Action, *J. Clin. Investigation* 18: 277-289, 1939.

13. Lahey, F. H.: Presentation of Henry Jacob Bigelow Gold Medal, with Introductory Remarks, *New England J. Med.* 236: 45, 1947.

muscles. Mass ligation of the superior poles is undesirable. It leaves thyroid tissue in amounts that cannot always be assessed, and it results in injury to the superior laryngeal nerve, thus predisposing to excessive mucous secretion in the trachea.

Postoperative Sequelae and Treatment.—Crisis is the most dreaded of the postoperative sequelae. It is now so infrequent that younger surgeons rarely see this complication and may therefore underestimate its importance. Perfect anesthesia reduces the risk of a severe reaction. The intravenous use of dextrose during and after operation, as suggested by the late Charles H. Frazier,¹⁴ assists in reducing its incidence and severity, and the use of adequate amounts of blood, when necessary, is of further help.

When crisis occurs, as it did in 3 of our cases, therapy should be begun at once. The blood volume must be maintained, dextrose and iodine given intravenously and attention directed to any specific electrolyte imbalance. Large amounts of sodium salts should not be administered if the imbalance is one chiefly associated with potassium disturbance, and neither should be administered without careful study if renal function is impaired.

Adequate sedation, oxygen therapy, cardiac support when indicated and the use of some method of refrigeration in the presence of pronounced hyperpyrexia are all of value. Adequate doses of all components of the vitamin B complex should be given, parenterally, when necessary. Propylthiouracil may also be of assistance.

Tetany: Acute traumatic parathyroid insufficiency, while rarely fatal, may be an important cause of postoperative morbidity. Its treatment is too well standardized to require comment here. In many cases the insufficiency is self limited, and spontaneous readjustment may occur up to six months after injury. Recognition of the early symptoms is important. Such symptoms may include vague nervousness and apprehension, insomnia, paresthesias of the face or extremities and minor twitching of skeletal muscles. Immediate reimplantation into the ribbon muscles of the neck of any tissue excised at operation which resembles the parathyroid may prevent postoperative hypoparathyroidism.

ANALYSIS OF CASES

Number of Cases.—We wish now to report on 655 thyrotoxic patients operated on in the ten year period prior to June 1947.

The mean age of the entire group was 40.6 years. Of the total, 145 (22.2 per cent) were male and 510 (77.8 per cent) were female. Four hundred and fifty-two (69 per cent) of the patients had diffuse toxic goiter and 203 (31 per cent) toxic nodular goiter. There was associated pathologic evidence of chronic thyroiditis in 19 of the patients and a single instance of carcinoma (0.15 per cent). This is a much lower incidence of malignancy than that reported by most other writers.

There were 82 patients (12.5 per cent) with serious heart disease. Twelve of the patients were admitted to the hospital in cardiac decompensation. Forty had fibrillation and 4 auricular flutter. Forty were decidedly hypertensive. Twenty-four had true diabetes mellitus and 6 active pulmonary tuberculosis. Seven

had syphilis which required therapy, and 3 were pregnant. The average period of preoperative iodine administration while in the hospital was 12.3 days. Many had received it for a variable period prior to admission. The mean period of days of thiouracil therapy was 37.2 days, of aminothiazole 17.5 days and of propylthiouracil 67.8 days.

The exact type of preoperative therapy prior to admission often could not be determined with certainty, but nearly one half of the patients had received iodine before hospitalization, and 20 had had long periods of radiation therapy.

The patients with diffuse toxic goiter showed a mean basal metabolism rate of plus 42 per cent, and those with toxic nodular goiter of plus 58 per cent.

One hundred of the patients were operated on with local anesthesia alone. In this group there was 1 death (1 per cent). Twenty-six received tribromoethanol solution (avertin®) and local anesthesia with 2 deaths (7.7 per cent), and 529 had received one or another type of inhalation anesthesia with or without local anesthesia. In the latter group there were 3 deaths (0.57 per cent). The over-all mortality rate was 0.9 per cent.

Twenty patients who had not shown fibrillation prior to operation did so subsequently, and in another pericarditis developed. There were 3 instances of true crisis (0.46 per cent). No patient died in crisis subsequent to the use of iodine plus thiouracil or propylthiouracil in the preoperative period.¹

Of the 6 deaths, the cause of death was recorded as follows:

1. Cardiac arrest at operation, cerebral anoxia, error in anesthesia management.
2. Cardiac decompensation, two days after operation.
3. Cardiac decompensation, twenty-six days following thyroidectomy.
4. Sudden cardiac failure. The autopsy report was postoperative "cardiogenic" shock. Microscopic examination of the tissues failed to reveal any further information as to the cause of death.
5. True post-thyroidectomy storm.
6. Staphylococcus septicemia with multiple visceral abscesses. Death occurred twenty days after operation.

Twenty-three patients (3.5 per cent) had postoperative impairment of the motion of one vocal cord. Of these 23 patients, 20 recovered completely. The incidence of permanent cord injury in the series of 655 patients was therefore 0.46 per cent. Two patients showed evidence of hypoparathyroidism.

All thyrotoxic patients are requested to return to the follow-up clinic at regular intervals after operation. If this is not possible, follow-up reports are obtained from the referring physician. The average duration of follow-up for the entire living group has been 2.7 years.

The average basal metabolic rate for the entire group at the last follow-up visit was plus 3.7 per cent. Fifteen patients (2.3 per cent) had recurrent thyrotoxicosis.

COMMENT

Our experience, therefore, indicates that the thyrotoxic patient may be treated surgically with an operative mortality risk of less than 1 per cent and with less than 4 per cent risk of recurrence of the disease. There are, to be sure, other immediate and late postoperative complications to be reckoned with, but they are, in

14. Frazier, C. H., and North, J. P.: Carbohydrate Metabolism in Hyperthyroidism: Continuation Study, Tr. Am. A. Study Goiter, 1933, p. 203.

general, not formidable. It should be emphasized, however, that all phenomena of thyrotoxicosis do not by any means disappear when a euthyroid level of metabolism is attained. Many patients classified in follow-up reports as showing good results retain certain stigmas of their disease (exophthalmos, tremor, fatigue, nervousness, vasomotor instability) even though they are economically rehabilitated.

Thyroidectomy is too often incorrectly regarded as an end point in the clinical history of the thyrotoxic patient. The fallacy of this point of view is amply attested by the frequency with which residual symptoms persist indefinitely and by the occurrence of relapses as long as twenty years after operation. Thyroidectomy should be regarded as a therapeutic incident, albeit a major and usually successful one, in the natural history of thyrotoxicosis. Patients should be inspected periodically for at least five years after operation and requested to report their condition by letter at intervals of one to two years thereafter.

In spite of its empiric nature, its hazards and its limitations, we believe that subtotal thyroidectomy when expertly performed after optimal preoperative preparation remains the most effective method presently available for the production of permanent remission of thyrotoxicosis in unselected cases.

SUMMARY AND CONCLUSIONS

The various forms of treatment now available for the control of thyrotoxicosis are reviewed. The present status of thyroidectomy has been examined with particular reference to our experience in the operative treatment of 655 cases over a ten year period. The most important nonsurgical methods for the treatment of thyrotoxicosis at present are: (1) goitrogenic compounds (6-propyl-2-thiouracil) and (2) radioactive iodine. The former is far less effective than thyroidectomy in producing permanent remission. The latter has received too limited a trial to permit final conclusions regarding its efficacy and safety. Subtotal thyroidectomy, when performed under optimal conditions, remains the most effective form of therapy in thyrotoxicosis.

ABSTRACT OF DISCUSSION

DR. HAROLD L. FOSS, Danville, Pa.: This has been an able review of the physiology of the thyroid gland and of the accepted therapeutic procedures in the treatment of diseases peculiar to it. I agree with all that Dr. Ravdin and associates have presented in their excellent paper. One might emphasize the incalculable value of Astwood's clinical researches. Interest in the subject was reawakened six years ago by the work of the MacKenzies at Johns Hopkins Hospital on goitrogenic drugs and that of Richter and Clisby on goiter depressant substances—thiourea and related compounds. Search for a substance which would inhibit thyroid function but which did not possess the unpredictable potencies of thiouracil resulted in the preparation of some four hundred drugs. Those having the greatest effect were derivatives of thiourea, all having in common the thioureylene radical, NH-CS-NH . Continued investigation resulted in the synthesis of propylthiouracil. The biologic effects of irradiation by radioactive iodine is referred to by the authors. Hertz and Williams of Boston, Soley of the University of California, Haines and his associates of the Mayo Clinic and many others have reported encouragingly on results of this treatment of hyperthyroidism. In using these substances one must bear in mind the carcinogenic hazards. Time so far elapsed is too short for definite conclusions to be drawn. The same is true regarding the treatment of carcinoma of the thyroid with isotopes. Treatment, particularly of the

papillary and allied forms, by this therapy, has not been very promising. Methylthiouracil seems to offer some promise in hyperthyroidism, yet there is some question as to its value being any greater than propyl itself. It is appropriate to call attention to the large number of patients who suffer from hyperthyroidism and yet have no goiter; toxic diffuse goiter (Graves' disease), in its incipency, unquestionably can be controlled, especially with propylthiouracil. One might sound a warning against too optimistic an approach to propylthiouracil therapy in all cases of toxic diffuse, or exophthalmic, goiter. At the same time one might caution against the indiscriminate thyroidectomizing of patients with goiters who are suspected of having hyperthyroidism, the diagnosis being made on spurious elevated rates. The high percentage of carcinomas which develop in fetal adenomas should always be borne in mind. The importance of the prophylactic removal of discrete nodules suspected of being true adenomas must never be lost sight of.

DR. WARREN H. COLE, Chicago: The philosophy suggested by Dr. Ravdin and his co-workers regarding the treatment of thyrotoxicosis is similar to that maintained by my colleagues and me. They use propylthiouracil in a manner similar to that which we have adopted. We likewise are not optimistic about the effects of irradiated iodine. They very correctly have advised a heavy dosage of vitamins. In general, we give propylthiouracil only to prepare patients for operation, but in some cases we give it with the assumption that we may obtain a permanent remission, for example, in patients with mild toxicity and small glands and those having recurrent hyperthyroidism. In a group of 14 patients with an average basal metabolic rate of only plus 28 per cent, we obtained permanent remission in 70 per cent. In a group of 20 patients with an average basal metabolic rate of about 52 per cent above normal, we had 50 per cent remissions lasting at least one year. However, these figures cannot be used as an index of incidence of permanent remissions following propylthiouracil therapy since these patients are in reality closely screened. In general they had small glands and had had symptoms only for a short time. If the patients have large glands we rarely try to obtain permanent remission, since we found out early in our experience that recurrence was almost universal when treatment with the drug was stopped, particularly when toxicity was severe. I agree with the authors that it is highly desirable to have the basal metabolic rate approach normal before thyroidectomy is performed. I am convinced that the operative mortality rate will be definitely lower if operation is postponed until the basal metabolic rate is reduced to a normal or near normal figure. We have had no deaths in about 100 patients having thyroidectomy following propylthiouracil therapy. When one summarizes the experience of many men reporting results of thyroidectomy following propylthiouracil one obtains information supporting the statement that the mortality rate is lowered by this therapy. I do not routinely isolate the recurrent laryngeal nerve, but I do insist on good exposure. Accordingly, I would not hesitate to cut the strap muscles or to move to the other side of the table to remove the second lobe if exposure is doubtful.

DR. I. S. RAVDIN: I wish to thank Dr. Foss and Dr. Cole for their discussions. I am in complete accord with what they have said. It was not possible in the presentation of this paper to give adequate historical credit, but this is given in the footnotes in the paper. It is in the type of patient with mild symptoms of hyperthyroidism and a slightly enlarged goiter that propylthiouracil frequently gives its best results. We have had a highly selected group of patients who have been treated in our Endocrine Clinic with propylthiouracil for a period of six to twenty-four months. Not more than 50 per cent of this very highly selected group of patients have maintained a permanent remission after stopping treatment with the drug. One therefore cannot look for a high incidence of cures from the use of propylthiouracil or any related compounds in an unselected group of patients with hyperthyroidism. It has seemed to all of us in our Endocrine Clinic—the internists, the radiologists and the surgeons—that at present a radical resection of the thyroid gland is the most adequate and favorable means of permanently controlling the thyrotoxic state.

DEVELOPMENT OF DOUBLE-LUMENED TUBE
FOR INTESTINAL INTUBATIONT. GRIER MILLER, M.D.
Philadelphia

In 1934 the late William Osler Abbott and I¹ introduced small intestinal intubation as a practical clinical procedure. It was not the first time that the human small bowel had been intubated or that the significance of such a procedure had been appreciated. It was merely the first time that a technic had been described that permitted the ready accomplishment of the desired objectives. This was rendered possible by the development of a double-lumened rubber tube and the attachment at its distal end of a collapsible balloon.

PREVIOUS HISTORY

Although we were not familiar with his work until shortly before our original publication, Scheltema,² a Netherlands pediatrician, in 1908, twenty-six years earlier, had accomplished in children what he termed "permeation or automatic sounding of the alimentary tract." The idea that such intubation could be accomplished passively (without activity on the part of the operator) occurred to him as a result of his observations of a horse hair protruding from each end of the digestive tract of a chicken and of strings dangling from the anus of dogs and cats. Then he conducted experiments on various animals and secured the passage of mercury-filled tubes through the digestive tract of frogs. Being assured of the safety of the procedure he finally tried it out in a few children in the following manner. After cocainizing the nasal mucosa he introduced his tube through the nose, brought the distal end out through the mouth, inserted a bicycle bearing ball to act as a "pilot bob" and then reintroduced the expanded end through the mouth into the stomach. Thence it was propelled onward by peristaltic waves. He found that eighteen to sixty hours were required for its passage into the duodenum, but that the subsequent transit was rapid. His tubes varied from 12 to 24 mm. in circumference (12 to 24 F), and they had sufficiently thick walls to permit the aspiration of intestinal contents. He referred to the possible use of the technic in the physiologic and bacteriologic study of the small intestine, in the diagnosis of disease, including obstruction, and especially in the administration of fluids and the local application of medicaments to disease processes.

During the following year, in 1909, Einhorn³ first demonstrated his "duodenal pump" at the German Hospital and Dispensary in New York, and ten years later, still without knowledge of Scheltema's accomplishments, he⁴ introduced a 15 to 20 foot long (4.57 to 6.1 meters, 8 F) tube for the instillation of fluids into the intestine, the lumen of the tube being too small for the aspiration of contents. During the following

year Buckstein⁵ referred to the use of such a tube for the injection of a barium mixture and the radiologic study of small intestinal loops; he also suggested its use for the chemical and bacteriologic studies of the intestinal contents. McClendon,⁶ in the same year, passed a tube 7 feet (213 cm.) beyond the mouth, using a 6 Gm. iron weight attached by means of surgical gut, thus allowing the weight to be released and passed after digestion of the surgical gut. His objective was the study of the reaction of the intestinal contents. This was followed by Einhorn's⁷ development of an ingenious jointed intestinal tube, consisting of four or more separate meter length tubes, each one as it was swallowed having another segment attached by a small screw. Through that tube he claimed to have made collections from the upper levels of the intestine, but reported no studies. Four years later van der Reis and Schembra,⁸ in Germany, published a report showing radiograms of small caliber, mercury-filled tubes passed throughout the entire length of the human bowel. They first called attention to the relatively short tube that was required to traverse the entire digestive tract. In 1931 Jones and Pierce,⁹ for the study of pain reference, developed the method of attaching a collapsible balloon to the distal end of an intestinal tube. They apparently did not employ the balloon for the advancement of the tube, but inflated it from time to time to produce pain.

Meanwhile, about 1915, stimulated by Hertz's experiments and book, "Sensibility of the Alimentary Canal," by Carlson's then current work on the motor functions of the stomach and by Einhorn's studies of the duodenal contents, I decided to study the small intestinal secretions and attempted intestinal intubation. I was discouraged, however, by the time required to reach the lower bowel with the available small Einhorn tube and soon abandoned the attempt. Again, in 1921, when the jointed tube was described, I resumed the project and on a number of occasions succeeded in securing the entrance of the tube into the ileum, but again several days were required, the patients became exhausted and no satisfactory specimens could be obtained. The work again was abandoned.

DEVELOPMENT OF THE MILLER-ABBOTT TUBE

Then, in 1930, Abbott, previously trained in physiology and pharmacology, became a member of my staff. He wished to carry over to human beings certain experiments on the motor effects of various drugs on the duodenum and for that purpose was employing a balloon tied over the distal end of a duodenal tube. He was repeatedly frustrated in the midst of securing kymographic records by having the distended balloon slip beyond the duodenum. It then occurred to me that such spontaneous and rapid transit of a distended balloon might solve the problem of intestinal intubation, and the suggestion was made that he give more slack to the tube and follow its progress under the

fluoroscope. To our surprise the tube passed rapidly and within a few hours was in the lower part of the ileum. It then remained only to repeat the experiment with a second tube attached to the first one just behind the balloon. In this way we at once had available an apparatus that readily could be introduced and an open tube through which injections could be made into the bowel and the intestinal contents aspirated. Further observations soon led to a realization that, instead of a 15 to 20 foot tube, such as Einhorn's, one of half that length was sufficient to reach the cecum. This is explained by the fact that during life the bowel is contracted lengthwise and also that the tube tends to hug the mesenteric border of the bowel or to follow the shortest course from one loop to another, at times bringing about some plecting of the intestinal wall.

The next step was to simplify the procedure by using a double-lumened tube, one lumen for the control of the balloon, inflating it when the duodenum was reached and deflating it when it was desired to stop the progress of the tube; the other, for the aspiration of contents or for the injection of fluids directly into specified segments. Also, the balloon manifestly supplied a means for recording pressure changes at various areas of the bowel.

We knew that double-lumened tubes had been manufactured for urologic work; also that Einhorn had secured them for esophageal and gastric work, but we did not appreciate at the time that such tubes had been made by hand, being rolled over a mandrel and wrapped with fabric to hold the rubber in place during the vulcanizing period, or that tubes of greater length had not been, and probably could not be, so made. Rubber manufacturers throughout this country, France and England were appealed to, but with one exception they declined to attempt its development. The United States Rubber Company alone agreed to make the effort, employing the extrusion process and admitting that the product could not be of high grade. That organization succeeded within a few months, and after a year's experimenting we¹ published our first paper on the subject.

TECHNIC AND USES

With such a tube, modified from time to time, we soon found it possible, without unduly disturbing the subject, to intubate the small bowel at will and often also the large intestine, to make pressure readings within the limits of the method, to secure satisfactory specimens for chemical and bacteriologic studies and to introduce barium and other mixtures for the study of anatomic defects along the course of the alimentary tract.

In our original paper¹ we suggested that the method might eventually aid in the diagnosis and treatment of intestinal lesions. Meantime our staff¹⁰ undertook various studies on the secretory, motor and absorptive functions of the tract. Also, with the help of Rawson, Abbott¹¹ adapted the tube for the simultaneous aspiration of stomach contents and the instillation of fluids and nutriment into the small bowel after gastroenterostomy. A three lumen tube¹² was developed for

the collection of uncontaminated small intestinal secretion and for the study of absorption from an isolated segment of the intestine, later modified by Nicholson and Chornock.¹³ Other variations permitted a study of pure gastric and duodenal secretions and absorption¹⁰; also, a study of effects of drugs on the colon (Elsom and Drossner¹⁴) and continuous records of pressure changes as the balloon descended along the bowel (Ingelfinger and Abbott¹⁵). Additional modifications of the technic have been developed in other clinics.

It was not until 1938, however, that the technic for intubating the obstructed bowel was introduced.¹⁶ That followed a suggestion by Charles G. Johnston, then on the surgical staff of our hospital, that gastroduodenal drainage, as introduced by Wangenstein and Paine,¹⁷ might be even more effective if the intestine itself could be intubated. He requested that the new technic be tried out in such a case. He sought Abbott's help, and in their first patient, an elderly man with tremendous distention due to an ileocecal intussusception, the tube readily entered the intestine and, as the drainage was maintained, it rapidly passed along the bowel, soon bringing about complete deflation. In their first report they referred to 16 cases, in 13 of which there had been successful intubation. These included cases of both paralytic ileus and mechanical obstruction.

Subsequently the technic was adopted by various surgeons elsewhere, especially by members of the staff of Whipple¹⁸ at the Presbyterian Hospital in New York, where it soon became a routine procedure and where by 1940 it was regarded as one of the three factors responsible over an eight year period for a reduction in the mortality rate of intestinal obstruction from 29.6 to 6.5 per cent. To Whipple is due much credit for its recognition as a helpful practical procedure.

RECRUITING SUBJECTS FOR EXPERIMENT

It is not my intention at this time, however, to refer to the value of the procedure, but rather to limit myself to points of historical interest. In this connection I wish finally to call attention to Abbott's¹⁹ inimitable description of some of the difficulties attendant on his use of hired subjects for the earlier experiments. As typical of the humorous nature of his presentation before the Charaka Club, I shall paraphrase briefly one feature of it.

Having exhausted the hospital personnel, including patients and members of the staff, and having failed to secure recruits on a fee basis through various welfare agencies and churches, even beggars and the jobless of that day of depression, Harry, the Negro janitor, was

called in and offered 50 cents for every able-bodied subject, sober and on hand at 8:30 a. m. The subject himself was to receive \$2, the usual cost of a dog. The first comer was Flip Lavall, tall, broad shouldered, black as the ace of spades, a lightweight prize fighter; after him, Jim and Dan and Slim and others. One was an epileptic, who in a convulsion bit through his tube and then passed it per rectum. One had a 38 caliber revolver bullet in his erector spinae muscles, which was mistaken for the metal tip on the tube until it was found impossible to manipulate the object into the duodenum.

On the day preceding a scheduled exhibit at the 1935 American Medical Association meeting in Atlantic City, all of these professionals went on strike for double wages. The blackamoors were promptly fired, lock, stock and barrel. Incidentally an impassioned appeal to third year medical students in the midst of their final examination for the year saved the day. The volunteers stood up like veterans of the line and enabled the exhibit to receive a Special Certificate of Honor from the Association.

Finally it was revealed that for one and a half years Flip had had his crew so organized that each of them regularly made a financial cut to him; otherwise having the "daylight beat out of him." It was Flip who organized the strike to increase his wealth. Eventually all but two of the group landed in gaol, Flip for rape and the others for burglary.

COMMENT

This story of the development of the double-lumen tube for intubation cannot be told, however, without again giving maximal credit to Abbott for his energy, perseverance and ingenuity in perfecting the procedure on a practical basis. To Karr and to Glenn, both also now deceased, much credit is due; also to the other members of our staff during the 1930's: Elsom, Warren, Drossner, Boon, Ingelfinger, Zetzel, Machella, Nicholson and Moseley. I also wish to pay tribute to Sarah G. Miller, who, as a volunteer worker, patiently supervised all of the early subjects, both patients and hired tube swallows, and who herself was wholly responsible for the accomplishment of many of the original intubations.

Q Fever in Los Angeles Raw Milk.—In California, where intensive studies of Q fever are being carried out by the California State Department of Public Health and the United States Public Health Service, the disease has been found in 16 counties in a period of less than one year. In Los Angeles County, where Q fever appears to be endemic, more than 300 cases and three deaths have been studied. Results of surveys including more than 3,000 persons indicated 1 per cent of the persons residing in the endemic area possess serum antibodies for Q fever. A recent report announced that C. burneti was present in the raw milk supply of four of five widely separated dairies in the Los Angeles area. An extension of these studies has indicated that the raw milk of more than 60 per cent of the 63 dairies tested in the area contain sufficient quantities of C. burneti to readily infect guinea pigs and that more than 10 per cent of approximately 4,000 cows are infected. Fortunately, commercial pasteurization methods in rigidly controlled field tests appeared to be nearly 100 per cent effective in eliminating the infection from milk.—Robert J. Huebner, William L. Jellison and M. Dorothy Beck, *Annals of Internal Medicine*, March 1949, page 495.

CONTINUOUS SUCTION DRAINAGE

A Historical Evaluation of Intestinal Obstruction

JOHN R. PAINE, M.D.
Buffalo

In August 1931 Wangenstein first employed the principle of continuous suction transmitted through a duodenal tube as an effective means of treatment in certain cases of intestinal obstruction involving the small bowel. In a historical sense this procedure was the natural evolution of the use of duodenal tubes in the diagnosis and treatment of various diseases affecting the gastrointestinal tract. It should be remembered that the duodenal tube, in contrast to the stomach tube, was entirely an American development and was the direct result of the desire of clinicians to obtain samples of duodenal contents for diagnostic purposes.

In the wake of the work and experiments of such men as Turck,¹ Hemmeter² and Kuhn³ during the last decade of the nineteenth century, Gross⁴ and Einhorn⁵ of New York, independently and almost simultaneously, presented to the medical profession simple practical duodenal tubes which could be passed consistently into the duodenum. Both of these tubes had perforated metal capsules attached to long rubber tubes with relatively small lumens. In a few hours, gastric peristalsis aided by gravity caused these tubes to pass from the stomach into the duodenum.

Internists were the first fully to grasp the significance of the opportunities afforded by this simple new instrument. Its use quickly spread to Europe, and literally dozens of men began to use it extensively. The literature on this subject after 1910 is voluminous, and suggested improvements were numerous. For the most part, however, the principle of a weighted tip and a narrow soft rubber tube of small diameter was retained until Levin of New Orleans in 1921 described his smooth catheter-tipped duodenal tube.⁶ This tube had a great advantage over other duodenal tubes in that it could be passed directly through the nares and was better tolerated by the patient when kept in place for a relatively long time.

The examination, plus analysis, of samples of duodenal secretions was the prime purpose for which the duodenal tube was invented and continued to be its most important use up to about 1920. After that, however, the use of such tubes in the treatment of diseases became more prevalent, so that by 1931 the greater part of the publications concerning this instrument dealt with its use in the treatment of gastric and intestinal distention. Westermann,⁷ as early as 1910, reported 15 patients with severe peritonitis with ileus

treated by continuous siphonage of the stomach by means of a small tube passed through the nose. This surgeon remarked that the efficiency of this method of treatment was not all that might be desired, because of periodic interruption of the siphonage action by gas which entered the tube. A year later Kappis⁸ reported 10 similar patients treated in the same way and warmly recommended the procedure. Further endorsement was forthcoming from Kanavel⁹ in 1916. Following the advocacy of this method of treatment by Matas¹⁰ in 1924, practically every treatise written on post-operative treatment included the use of the duodenal tube for siphon drainage postoperatively in cases of persistent vomiting or distention.

WANGENSTEEN'S CONTRIBUTION

The aforementioned facts were known in a general way to Wangensteen in 1931. He did not know, however, that Ward of San Francisco had described an apparatus for continuous gastric or duodenal lavage through a Jutte tube and recommended its use in the treatment of general peritonitis, postoperative ileus, intestinal obstruction and acute gastric dilatation. This apparatus exerted a constant mild suction on the indwelling tube.¹¹

On a hot day early in August of 1931 a somewhat corpulent man in the middle sixties with decided abdominal distention was admitted to the University of Minnesota Hospitals. His chief complaint was severe prostrating pain in the upper part of the abdomen which had appeared suddenly forty-two hours previously, while he was changing a tire on his automobile. At operation he was found to have a peptic ulcer which had perforated the anterior wall of his stomach and produced generalized peritonitis. After closure of the perforation, Wangensteen inserted a catheter through the wall of the stomach and brought it out through the abdominal incision as a gastrostomy. Retalling the reports of Westermann⁷ and Kappis⁸ and knowing also that McIver¹² in 1926 had shown that the major component of intestinal gas came from swallowed air, Wangensteen assigned to the resident and intern on the service the duty of keeping the stomach empty and suggested that, if possible, some means be found of maintaining constant suction on the gastrostomy catheter.

After an evening and a night of improvisation and trials with such utensils as enema cans, bottles and five gallon buckets, the following morning saw the simple but extremely effective apparatus made of two large bottles together with odd pieces of glass and rubber tubing now widely used and known as "a suction set." This first patient survived forty-two days after operation and then died of his peritonitis. During this six week period, suction was maintained on the catheter most of the time and the distention of the abdomen was well controlled.

Encouraged by the result obtained in this patient as far as control of the distention was concerned, Wangen-

steen speculated as to whether or not this method might not have some virtue in the treatment of mechanical obstruction of the small intestine due to adhesions. He had observed in such cases that after enterostomy, without any direct surgical attack on the adhesions, drainage of fluid through the enterostomy catheter was often minimal after the initial decompression had been effected and that frequently the obstruction was relieved without further operative intervention. This logically suggested the possibility that if the distended proximal gut of a patient with mechanical obstruction of the small bowel could be effectively drained by means of a duodenal tube connected to a source of constant suction, operation might be avoided.

During the early evening of a day in the latter part of August 1931 there was admitted to the University of Minnesota Hospitals a poorly nourished woman of 72 in a state of hypochloremia with pronounced distention of the abdomen due to a mechanical obstruction. The cause of the obstruction was thought to be a carcinoma of the cecum. Vomiting had been profuse for several days. This patient was in an extremely poor general condition—such a poor condition, in fact, that an immediate operation seemed out of the question. After a careful appraisal of the situation and the risks involved, Wangensteen decided to apply constant suction to an indwelling Levin type duodenal tube while adequate quantities of isotonic sodium chloride solution and dextrose were given by vein. Decision as to when the patient would be operated on was postponed until the following morning. By good fortune the duodenal tube soon passed through the pylorus, and by the following morning the patient was much improved. Roentgen examination of the abdomen confirmed the clinical impression that the intestinal distention had decreased a great deal. Suction was continued for the next thirty-six hours. During this period the degree of abdominal distention continued to decrease until decompression was complete. At this point the patient was operated on, since the obstruction was thought to be of a persistent nature. A stricture of the terminal portion of the ileum was found, and the patient made an uneventful recovery.

The results in this case made a profound impression on every one concerned. Successful decompression had been achieved in a practically moribund patient by the use of a duodenal tube, and her general condition sufficiently improved by the intravenous injection of isotonic sodium chloride solution and dextrose, so that definitive operation could be performed with a great deal less risk than in the average patient with intestinal obstruction. During the succeeding weeks, 2 patients with obstruction of the small bowel due to adhesions were treated by continuous suction drainage alone. Decompression required about two days, and the obstruction was spontaneously relieved. In a fourth case of adhesive obstruction, the method failed. In this case recovery followed the making of an enterostomy.

On the basis of his experience in these first 4 cases, Wangensteen, firmly convinced of the value of this new method, described and recommended it to the profession in December 1931 at the meeting of the Western Surgical Association in Denver.¹³

During the following winter and spring, Wangenstein and his colleagues studied this new procedure critically and extensively. Certain of its limitations were seen immediately. In his first article on the subject Wangenstein said, "In adhesive types of obstruction in which the cause often ceases to operate following decompression of the bowel, the method should have its greatest field of usefulness, and in postoperative obstructions particularly, the method should prove to be an agent of therapeutic value."¹³ Experience has well borne out these claims. It was realized that only harm could come from treating strangulation obstructions definitively by this method. Experience soon showed that, in the presence of an acute obstruction of the large bowel, suction usually prevented the distention of the colon from increasing but could not be expected to decrease it because of the ileocecal valve.

Other phases of the method were studied also. Since successful decompression was found often to rest with the ability of the clinician to cause the tip of the duodenal tube to pass beyond the pyloric sphincter, considerable effort was made to improve the passage of such tubes. No easy method was found. Meticulous attention to detail and careful frequent clinical and roentgen examination of the patient was essential. Two changes were made in the Levin type duodenal tube. One was the construction of the distal tip of the tube with special rubber of high specific gravity. The other was the extension of the perforations of the tube proximally over 9 inches (23 cm.), so that suction might be simultaneously carried out in both the stomach and duodenum. The possibility of utilization of a long tube with a double lumen was discussed on one occasion, but no actual efforts along this line were made until after the development of the Miller-Abbott tube.

No essential improvement was made on the simple suction apparatus improvised for the first patient at an estimated cost of about 50 cents. The addition of a third bottle allowed for the collection of the aspirated fluid, but both the two and the three bottle system permit the accurate measurement of both the fluid and gas return by the suction tube. This apparatus provides an average negative pressure of about 90 cm. of water, a pressure which laboratory studies have shown to be in the optimal range. The relative superiority of constant suction over siphonage through a duodenal tube was tested in patients postoperatively by means of a Mariotte bottle.¹⁴ The results of this study were so definite that it was immediately realized that the continuous suction method was by far the best means yet devised of treating paralytic ileus. As a result the suction principle has seen its widest use not in the treatment of mechanical obstruction but in the care of patients after major abdominal operations.

By the summer of 1932 Wangenstein and Paine¹⁵ had treated 32 patients with acute mechanical obstruction of the small bowel in which suction applied to an indwelling duodenal tube was employed. The mortality rate in this group of patients was 22 per cent. Twenty

of these patients were treated by suction alone with spontaneous release of the obstructing mechanism after decompression had been achieved. Only 3 of this group died, a mortality rate of 15 per cent.

COMMENT

The chief historical significance of Wangenstein's contribution lies in the fact that it marks the beginning of a downward trend in the mortality rate of patients with intestinal obstruction—the first such trend since the advent of abdominal surgery. Prior to 1931 the reported mortality rate of patients with intestinal obstruction varied, with only rare exceptions, between 30 per cent and 50 per cent. Recently reported series of cases show mortality rates of about 15 per cent. At Wangenstein's own clinic, where an intense interest in the whole problem of obstruction has existed for many years, Dennis and Brown¹⁶ in 1942 reported a mortality rate of 13 per cent. It cannot be claimed that the suction treatment alone is responsible for this decline. Factors such as a better understanding of the fluid and electrolyte requirements of the obstructed patient, better anesthesia, blood transfusions and better trained surgeons have all played a part. Suction applied to an indwelling duodenal tube has not replaced operation in the treatment of intestinal obstruction and never will. It has made surgical treatment safer, however, and has become an essential part in the treatment of all such patients. It has changed our thinking in regard to the urgency of operation in all patients with nonstrangulating types of obstruction of the small bowel. These patients, by the use of suction, can now be properly prepared for operation by the adequate administration of fluid and electrolytes and treated as patients for elective surgical treatment with much greater convenience to the surgeon and hospital staff. The fact that certain patients with obstruction, when treated by suction, do not require operation can gratefully be accepted as an additional boon.

Of major importance also is the effect of the application of the suction principle to the management of patients with paralytic ileus. Doctors who remember the days of protracted postoperative vomiting and the necessity of repeated gastric lavage by means of the large stomach tube will always be grateful for the suction principle. A surgeon in a small midwestern city once, with considerable truth, remarked that the "suction tube" had made a civilized business out of abdominal surgery.

Wangenstein was not the first to use suction, but he developed it independently, saw its value and popularized it. His contribution in 1931 marked the beginning of a new chapter in the understanding of the pathologic physiology of intestinal obstruction and in the treatment of patients with all varieties of this condition. As a result of his work, distention of the bowel and its secondary effects rather than some hypothetic toxin has come to be recognized as the most important factor in the pathologic changes of intestinal obstruction. As has been repeatedly shown in the history of medicine, a new concept has had a much greater influence than its discoverer anticipated.

STUDY OF HOME CARE IN A MUNICIPAL HOSPITAL

DAVID UNTERMAN, M.D.
ARTHUR C. DeGRAFF, M.D.
and
HENRY E. MELENEY, M.D.
New York

Home care represents an extension of medical and nursing service from the hospital to the home. It is one approach to the complex problem of providing continuous medical care to those segments of the population which do not enjoy this advantage at the present time. Home care is also an approach to the problem of hospital beds since it permits earlier discharge of the patient from the hospital and minimizes unnecessary readmissions through continuous medical follow-up. Experience has shown that it costs less to treat a patient at home than in the hospital, and, although such economy is by no means the prime objective of this program, it is nevertheless an important consideration in hospital administration.

A pilot study of home care was conducted on the Third and Fourth (New York University) Medical Divisions of Bellevue Hospital during the year beginning Jan. 1, 1948. This program was suggested by the study conducted at Syracuse University by Jensen, Weiskotten and Thomas,¹ who reported home care to be a highly successful method of extending continuous medical service to the discharged hospital patient. The present study was given further impetus by the encouraging reports of Bluestone² and Cherkasky³ of Montefiore Hospital in New York, where a home care program has been in progress since January 1947. The pilot study conducted at Bellevue Hospital represents the first application of the principles of home

care to a large municipal institution. Certain conclusions of general interest may be drawn, and these provide the basis for the present report.

SELECTION OF PATIENTS

The extension of medical care to the home requires close coordination of the activities of physician, social worker and nurse. Since the present program was organized on a small scale, the staff consisted of one physician, one social worker and one secretary. Nursing care was provided through a contract arrangement with the Visiting Nurse Service of New York.

Patients were selected from the hospital wards on the basis of their medical condition and adequacy of home environment. Each patient's condition was such that the specialized facilities of the hospital were no longer essential, although further medical care was still definitely needed. Home care was not extended to patients capable of attending the outpatient department, since the service was designed to bridge the gap which exists between hospital and clinic. Although a few of our patients were convalescing from acute illness, most of them were afflicted with chronic diseases and represented long term problems in medical care. The mean age was 57.7, with a range of 14 to 84 years. A diagnostic classification of patients selected for home care appears in table 1. It is noted that the largest single group is represented by the degenerative forms of cardiovascular disease.

A careful evaluation of the patient's home situation by the social worker was of major importance in determining eligibility for home care. This included not only a survey of the physical characteristics of the home but, equally or more important, the response of the family to the patient's illness. Both patient and family frequently required assistance in making certain adjustments occasioned by the advent of prolonged illness. Careful evaluation often necessitated a visit to the home before the patient was discharged from the hospital. Economic factors presented serious difficulties in some cases, inasmuch as many of our patients and their families existed on marginal incomes. In some instances, the return of the patient to the home represented an added burden which could not be borne without some assistance from the Department of Welfare. Such assistance made home care possible in several instances in which it otherwise could not have been instituted. The cooperation of other community agencies in planning for the care of the patient was also enlisted when necessary.

The decision to accept a patient to home care was made jointly by the physician and the medical social worker. The resident and visiting staffs were encouraged to make referrals on all patients presenting possibilities for home care. As the objectives of the program became more generally known, there was a gradual increase in the number of such referrals. There were frequent discussions with the hospital staff both before and after acceptance of patients to home care. Periodic reports were given on all patients followed at home for any appreciable length of time. These reports were of particular interest to the hospital staff in cases presenting diagnostic or therapeutic problems.

DESCRIPTION OF PROGRAM

Since continuity of medical care was stressed, the patient was interviewed and examined by the home care physician prior to discharge from the hospital. A personal physician-patient relationship, which was

This study was supported by a grant from the Milbank Memorial Fund. From the Departments of Medicine, Therapeutics and Preventive Medicine, New York University College of Medicine and the Third and Fourth (New York University) Medical Divisions of Bellevue Hospital, New York.

Dr. William S. Tillett and Dr. Charles H. Nammack, Directors of the Third and Fourth Medical Divisions, respectively, of Bellevue Hospital, cooperated in this study. Dr. Henrik M. C. Luyckx, Associate Professor, of Preventive Medicine, contributed helpful suggestions and analysis of data.

later perpetuated in the home, was thus established. Moreover, an opportunity was afforded the physician to become thoroughly familiar with the patient's clinical course and observations. Patients were usually sent home by ambulance, although transportation by taxi was equally satisfactory when patients could walk with

patients required the services of a urologist, a dermatologist and a general surgeon, respectively. Home care records were maintained in the same fashion as hospital charts. In addition to a complete summary of the patient's course in the hospital, they contained progress records by the physician, social worker and visiting nurse, as well as laboratory and all other data pertinent to the case.

RESULTS

During the twelve month period beginning Jan. 1, 1948, there were 53 admissions to home care. Eleven of these represent readmissions as a result of rehospitalization with subsequent return to the home. After an initial period of organization, the patient load was gradually increased to a maximum of 25. During the latter half of this study the average daily census rose from 13.9 to 23.9. There was a total of 3,960 patient days during the period of study. The duration of home care in each case is shown in figure 1. A total of 701 home visits was made by the home care physician. In addition to the regularly scheduled visits, there were 34 emergency calls. These additional calls were considered warranted in most instances, and several were occasioned by episodes leading to readmission of the patient to the hospital. The social worker made 262 visits and held 115 interviews with relatives of the patients. Nursing care was provided in 11 cases, representing a total of 145 visits by the visiting nurses. Housekeeping assistance was considered necessary in 7 instances. It was furnished by the program in 3 cases and voluntarily offered by friends and relatives in 2 others. In the remaining 2 instances, recommendations for housekeeping assistance were made to the Department of Welfare.

Fig. 1.—The duration of home care of 42 patients is indicated by the solid lines. Gaps in these lines represent periods of rehospitalization with subsequent return to home care. Dotted lines indicate patients transferred to the Department of Hospitals on completion of study.

assistance. After transfer to the home, the physician visited the patient regularly, usually once or twice weekly or more often, depending on the indications. He was also available at all times for any emergencies which arose. Although some patients manifested anxiety on their return to the home, this was usually dissipated with the realization that continuous medical care was still available.

The social worker also maintained frequent contact with the patient and family throughout the period of home care. The continued interest of the worker in the case and the close attention given to problems which frequently arose played a most important role in the satisfactory management of patients at home.

Nursing care was provided by the Visiting Nurse Service of New York on a fee for service basis, at the request of the home care physician. The visiting nurse carried out routine nursing care and also assisted the physician in such procedures as the parenteral administration of medication, performance of paracenteses and other therapeutic measures. Another important function of the nurse was the instruction of the family in simple nursing procedures, thereby enlisting additional aid which otherwise would have been lacking. Patients were provided with any hospital equipment required for their adequate care at home. Included were such items as hospital beds, scales, syringes, needles and catheters.

Since the additional burden of illness in a family sometimes necessitated housekeeping assistance, this was also provided in selected cases up to eight or ten hours a week. Laboratory procedures, such as blood cell counts, urinalyses and examinations of the chemical content of the blood, were performed in the laboratory of the New York University College of Medicine clinic, specimens being delivered there from the home. Medication was provided by arrangement with the clinic pharmacy. The services of consultants in the various medical and surgical specialties were available. Three

Fig. 2.—Relationship between patient load and cost per patient day. The minimum cost was reached with an average daily census of 17 to 23.9. The vertical column of figures at the left shows the average cost per patient day (for the month), and the horizontal row of figures at the bottom shows the average daily census (for the month).

The cost of treating patients at home was calculated on the basis of total expenditure and included the following items: medical and nursing care, social service, secretarial assistance, housekeeping, transportation of patients and staff, medication, hospital equipment and laboratory work. Figure 2 shows the

decrease in average cost per patient day as the census was gradually increased toward a maximum level. During the last five months of the study, when an optimum patient load was reached, the average cost per patient day was \$2.38. This is approximately one fourth the cost of maintaining a patient in a municipal hospital, which is currently estimated in New York at \$9 per day. The cost figures cited for home care include the contribution by the Department of Welfare toward medical and nursing costs in 14 of the cases.

The response of the patients and their families to home care was favorable with few exceptions. Most patients preferred the privacy of their homes and the proximity of their families to the hospital wards. They were particularly appreciative of the individual attention received while at home and cooperated fully with the home care staff during the program.

During the period of study, only 10 patients could be discharged from home care to the outpatient department. This is not unexpected, since most of the patients were initially selected on the basis of chronic illness and decided disability. Seventeen patients required readmission to the hospital following variable periods at home. This was usually the result of pro-

gression of the disease or the appearance of complications not amenable to management at home. Eleven patients were subsequently returned to home care as soon as hospitalization was no longer required. Four patients died after readmission to the hospital. Two of these were patients with far advanced heart disease and severe decompensation. Another death was the result of widespread bronchogenic carcinoma, and in the fourth patient death was caused by massive hemorrhage from esophageal varices. There were, in addition, 2 deaths at home, both occurring suddenly in patients with advanced coronary artery disease. On completion of the study, home care was being continued for 24 patients.⁴

There was considerable question as to suitability, and in 354, or 61 per cent, the home situation was so poor as to preclude any possibility of home care. The remaining patients (14 per cent) were considered unsuitable because of the distant location of their homes. Assuming that this sample holds true for the entire hospital population, a sizable home care program is nevertheless feasible since there are over 60,000 admissions to Bellevue Hospital each year. On completion of the present study, the Department of Hospitals of the City of New York instituted a home care program in five of its general hospitals, including Bellevue, and it is contemplated that this service will be expanded in the future. It is likely that a larger proportion of patients can be selected in some of the other city hospital areas where general housing conditions are more favorable.

The number of days of hospitalization saved as a result of this program is difficult to estimate with accuracy. In some instances it is certain that the patients would otherwise have remained in the hospital indefinitely, so that each day of home care represents a substitute for a hospital day. In other instances, patients were sent home several weeks in advance of the expected date of discharge. Many of these required care at home for much longer periods than the probable remainder of their hospital stay, since they were unable to attend the outpatient department. In such cases, only the initial period of home care may be considered to have served as a substitute for hospitalization. However, the saving in hospital days is undoubtedly much greater, since readmissions to the hospital were reduced in number through continuous medical care. The same holds true for a number of patients who were selected for home care at the time of their actual discharge from the hospital. In the latter group, there was no immediate saving of hospital days, although it is certain that subsequent readmissions were held to a minimum.

The most gratifying aspect of this study has been the continuity of medical care which it has made available to patients for whom no such provision otherwise exists. Through proper selection, home care is applicable not only to patients who would ordinarily remain in the hospital for additional periods but to certain others at the time of actual discharge. On an active ward service, it is inevitable that a certain proportion of patients who require further medical care following discharge from the hospital will fail to receive it. The overcrowding of wards and the continuous need for keeping beds available for the more acutely ill often lead to the discharge of patients who are not capable of attending the outpatient department. The cardiac patient with decidedly diminished reserve who lives in a fourth floor walk-up apartment is but one example. This study has demonstrated that home care fills an important gap by extending medical care to indigent patients who no longer require the specialized facilities of the hospital but who are as yet unable to attend the clinic. Close integration of the services of the home care and outpatient departments is definitely indicated and should prove advantageous to both patient and hospital. In several instances, referrals were received from the cardiac clinic on patients who had lapsed in their attendance because of progressive diminution of cardiac reserve. These patients were satisfactorily managed at home, thereby averting an interruption of medical care and minimizing subsequent readmissions to the hospital.

COMMENT

The potentialities of a home care program in a municipal institution such as Bellevue Hospital are determined largely by the home environment of the patient population. Shortly after the initiation of this study it became apparent that, although suitable clinical material was abundant, the selection of patients was greatly limited by poor home conditions. During a three month period, most of the patients admitted to the Third Medical Division were carefully interviewed with respect to their home environment. Of 577 patients interviewed, only 92, or 16 per cent, were judged to have suitable homes. In 53, or 9 per cent,

4. These patients were transferred to the home care program now being conducted by the Department of Hospitals of the City of New York.

TABLE 2.—Total Cost of Home Care Program in Relation to Patient Load (Fig. 2)

	Average Daily Census (for the Month)	Cost per Patient Day
January.....	0	
February.....	0.8	\$13.48
March.....	2.9	12.04
April.....	3.9	9.26
May.....	6.8	5.19

September.....	18.7	2.07
October.....	17.0	2.11
November.....	17.0	2.25
December.....	23.9	2.41

The selection of patients was limited almost exclusively to the chronically ill, since these were considered most adaptable to the purposes of a pilot study. Home care is equally applicable to the convalescent phases of acute illness, and a few such cases were included in the present program. With such patients the average duration of home care is, of course, somewhat shorter and the turnover of patients should be correspondingly more rapid. A large service carrying many patients with short term illness should demonstrate a more immediate and tangible sparing of hospital beds than was evident in the present study. On the other hand, the problem of continuity of medical care over long periods of time, which figured so prominently in the present program, would be a relatively minor one. Actually, any home care program in a general hospital must inevitably deal with both short and long term illness. Further studies are indicated to determine which group should receive greater emphasis from the point of view of maximum economy of hospital beds and the efficient administration of home care.

SUMMARY AND CONCLUSIONS

A pilot study of home care as applied to a large municipal hospital is described. It has been demonstrated that home care is a practical means of extending continuous medical service to certain indigent patients for whom no such provision otherwise exists. The cost of maintaining a patient at home is approximately one fourth the cost of hospital care.

An economy of hospital beds is effected since certain patients may be discharged at an earlier date and unnecessary readmissions are avoided through continuous medical follow-up. Further studies on a larger scale and over a longer period of time are indicated to determine more accurately the number of hospital beds thereby released.

Clinical Notes, Suggestions and New Instruments

LIPOMA OF THE TONGUE

Report of a Case

LEO E. BRAUNSTEIN, M.D.
Chicago

This case is reported because of the unusual occurrence of a simple lipoma of the tongue. A survey of the modern textbooks of oncology and pathology fails to reveal any allusion to this condition, though the presence of lipoma in many other tissues and organs is well known.

The patient, M. C., a white woman aged 58, was admitted to the Illinois Masonic Hospital in March 1948 for treatment of a comminuted fracture of the patella. This was accomplished by open reduction, with a good result. Her peculiar speech drew my attention to a rounded mass bobbling around in her mouth. As she spoke she seemed to try to keep the mass from slipping out of her mouth.

This mass was about 2 cm. in diameter and attached by an elongated sessile base to the right anterolateral free border of the tongue, near the tip. It was of a soft rubbery consistency, on a soft base of apparently normal lingual tissue, covered by a layer of thinned mucosal epithelium, through which the tumor appeared pinkish gray. Its contour was smooth and lobate, and it could easily be delineated by palpation as it was very superficial. Grossly, it seemed to be innocuous. There was no tenderness locally or discomfort in swallowing. The patient stated that it had been present for years, but,

being symptomless, it had never concerned her. It was not until several months after the operation on the knee, when she was seeking employment, that she noted that her speech impediment was a handicap in securing a job; hence she had returned to have it removed.

The operative procedure was performed with local infiltration with 1 per cent procaine hydrochloride solution. The tongue was maintained in traction with a suture through its tip. Four mattress sutures through the full thickness of the tongue were placed for hemostasis along the projected line of incision, with plain surgical gut 00. The tumor was then excised, including a 5 mm. edge of normal lingual tissue. The upper and lower borders of the tongue were approximated with interrupted sutures of plain surgical gut 00. Recovery was uneventful. Dr. Lester King, of the Department of Pathology, examined the specimen grossly and microscopically and reported it to be a simple lipoma, with no unusual features.

SUMMARY

A case of lipoma of the tongue is reported. Although the lesion is exceedingly common, its location on the tongue seems to be rare.

Council on Physical Medicine and Rehabilitation

REPORTS OF THE COUNCIL

The Council on Physical Medicine and Rehabilitation has authorized publication of the following reports.

HOWARD A. CARTER, *Secretary.*

PARAVOX HEARING AID MODEL Y (YM, YC AND YC-7) ACCEPTABLE

Manufacturer: Paravox, Inc., 2056 East 4th Street, Cleveland 15.

The three new Paravox instruments, Models YM, YC and YC-7, are nearly identical in size, weight and appearance, and can be described together. They differ in that YM is provided with a magnetic receiver, while YC and YC-7 are provided with Brush crystal receivers. YC-7 is designed for low battery drain.

The instruments of this series are small "all in one" hearing aids. An aluminum alloy case contains microphone, amplifier and batteries. A wheel type combined on-off switch and gain control is located at right upper corner front. A white dot and a retaining snap make the "off" position distinctive and secure.

Near the middle of the back of the instrument is a metal lever-type switch called the "Duo-Range Control." It introduces or removes attenuation of about 12 decibels, apparently the same at all frequencies. The instrument has no tone control. The receiver cord is plastic covered and reversible.

Dimensions and Weight.—The instruments measured 60 by 87 by 19 mm. (2 $\frac{3}{8}$ by 3 $\frac{3}{8}$ by $\frac{3}{4}$ inch), disregarding clothing clip and duo-range switch. The weight, with batteries and receiver M, was just under 140 Gm. (5 ounces). With the crystal receiver, the weight was about 105 Gm. (4 $\frac{3}{4}$ ounces). The instruments require a 1.5 volt A-battery and 22.5 volt B-battery, both of the zinc-carbon type. The accompanying table summarizes the manufacturer's claims for battery-drain:

Model	Battery	Drain (Milliamperes)
YM	A	42
	B	0.42
YC	A	42
	B	0.44
YC-7	A	37
	B	0.18

The manufacturer submitted curves showing the frequency characteristics of each instrument. The acoustical responses of

Paravox Model Y,
Hearing Aid

the instruments met the requirements of the Council. The instruments were tried out in practice under the direction of a qualified investigator. They were reported satisfactory.

The Council on Physical Medicine and Rehabilitation voted to include the Paravox Hearing Aid, Model Y (YM, YC and YC-7) in its list of accepted devices.

BECK-LEE MODEL E ELECTROCARDIOGRAPH ACCEPTABLE

Manufacturer: Beck-Lee Corporation, 630 West Jackson Blvd., Chicago 6.

The Beck-Lee Model E Electrocardiograph is a portable string galvanometer. In the recording mechanism, a beam of light is cast onto a strip of sensitized paper 5.75 cm. (2½ inches) wide. The sensitized paper is later developed in a dark room.

It weighs 14.5 Kg. (32 pounds) and measures 23 by 22 by 36 cm. (9 by 8½ by 14¼ inches). The domestic shipping weight is 19.5 Kg. (43 pounds) and the foreign, 32.5 Kg. (74 pounds). This latter weight includes waterproof wrapping and sealing and wooden shipping case.

Beck-Lee Electrocardiograph, Model E

Accessories include one set of patient electrodes, one set of electrode straps (rubber), one tube of electrode jelly, one ground wire with ground wire clamp, one film mounting folder, an instruction book and a guarantee card. The set of patient electrodes consists of one round, flat electrode for use on the chest and three square electrodes with curved surfaces for use on the arms and left leg; these electrodes are made of nickel silver.

The instrument is built for operation on alternating current at 110 to 120 volts and draws 70 watts. Converters are available to permit operation on direct current.

Specimens of the Beck-Lee Model E Electrocardiograph submitted to the Council were subjected to tests. The instrument meets the "Minimum Requirements for Acceptable Electrocardiographs" published in THE JOURNAL, May 31, 1947, page 455.

The automatic developing camera which is being advertised at the present time as an accessory was not investigated.

The Council on Physical Medicine and Rehabilitation voted to include the Beck-Lee Model E Electrocardiograph in its list of accepted devices.

EDIN INK-WRITING ELECTRONIC CARDIOGRAPH MODEL 210 T, ACCEPTABLE

Manufacturer: Edin Electronics Company, 207 Main Street, Worcester 8, Mass.

The Edin Ink-Writing Electronic Cardiograph, Model 210 T, is a portable electrocardiograph, housed in a carrying case. Models are manufactured for operation on 110 or 220 volt circuits, direct current or alternating current at 60, 50, 40 or 25 cycles. When operating on 115 volts of 60 cycle alternating current, it draws 86 watts (0.75 ampere). The instrument comes equipped with an individual timing check device operated by a synchronous motor.

The equipment includes 4 limb electrodes, 1 chest electrode and handle, 4 limb straps, 4 electrode leads, 1 jar of electrode jelly, 1 roll (9,440 cm. or 3,600 inches) of chart paper, 1 bottle of ink and 1 double ground lead. The whole measures 25 by 21 by 43 cm. (9¾ by 5¼ by 17 inches) and weighs 13 Kg. (29¾ pounds). The shipping weight is 16 Kg. (35 pounds). According to the firm, the electrocardiograph is distributed and serviced by selected supply houses on a franchise basis.

The Council secured convincing evidence that this instrument met its published requirements for acceptability of electrocardiographs. The Council on Physical Medicine and Rehabilitation voted to include the Edin Ink-Writing Electronic Cardiograph, Model 210 T, in its list of accepted devices.

OTARION HEARING AID MODEL E-4 ACCEPTABLE

Manufacturer: Otarion Hearing Aids, 159 North Dearborn Street, Chicago 1.

The Otarion Model E-4 Hearing Aid contains microphone, amplifier and batteries in a single sturdy, metal case. The case measures 114 by 61 by 20 mm. (4½ by 2¾ by ¾ inch). Including batteries and receiver, it weighs 214 Gm. (7½ ounces).

One control combines "on-off" and tone control. The three positions of the latter are identified by 1, 2 and 3 dots. The various positions are adequately maintained by an appropriate snap action. Model E-4D has a built-in battery meter; otherwise it is identical with E-4.

The battery drain is stated to be 45 milliamperes for the "A" battery at 1.25 volts and 0.65 milliamperes at 22.5 volts for the "B" battery.

The tone control gives choice of slight, moderate or considerable low tone suppression. For an input of 60 decibels with volume controls set at ½, the manufacturer shows a response curve that is flat plus or minus about 3 decibels from 1,300 to 3,600 cycles per second. With the 2 dot tone control, the characteristic rises from 200 to 1,200 cycles per second almost linearly with a slope of about 6 decibels per octave.

The maximum acoustic output with high setting of the output control is 128 decibels at 1,500 cycles per second. The peak at 1,500 cycles per second is about 6 decibels above the general level for all tones below 1,000 cycles. According to the manufacturer's curves, the distortion is not more than 11 per cent at inputs of 80 decibels or less, tested at 400, 600, 800, 1,000, 1,500, 2,000, 2,500, 3,000 and 3,500.

Performance Tests.—Two subjects, both veteran users of hearing aids, participated in performance tests of this instrument. Subject A, aged 37, suffers from a mixed deafness with considerable high tone hearing loss. His loss for speech is 47 decibels. Subject B, aged 39, has a pure conductive deafness with a nearly flat audiogram. Her loss for speech is 49 decibels. For both subjects full volume and tone control "1 dot," i. e., minimum low tone suppression, was used. The acoustic gain for subject A was 48 decibels, for subject B, 50 decibels. The aided threshold of each subject is, therefore, 1 decibel better than normal. It is therefore possible that the maximum acoustic gain of the instrument is even greater than could be measured with these subjects. The low aided threshold is indirect evidence of absence of excessive internal electrical noise. The acoustical gain is obviously far more than the minimum requirement.

Discrimination tests with the same two subjects consisted of a phonetically balanced list of 100 monosyllables (recorded version) delivered at 60 decibel input level. The resulting levels of the subjects were 43 and 40 decibels respectively above their No. 9 thresholds. The scores are as follows:

	Amplification Without Hearing Aid	Own Aid	Reference Instrument	Model E-4	Difference
Subject A	92	71	85	89	+ 4
Subject B	94	77	76	88	+ 12
			Average		+ 8

It is noteworthy that the service booklet contains a wiring diagram of the instrument and a list of the parts with specifications and a functional diagram of the switches and controls. The service information begins: "In case of trouble, take your Otarion to the nearest first class radio repair shop, preferably one which is an Authorized Otarion Service Station. Any skillful radio repair man already has most of the equipment and knowledge necessary to give proper service on your hearing aid. Otarion can furnish the rest."

The Council on Physical Medicine and Rehabilitation voted to include the Otarion Hearing Aid, Model E-4, in its list of accepted devices.

Otarion Hearing Aid Model E-4

APPROVED INTERNSHIPS AND RESIDENCIES IN THE UNITED STATES

ANNUAL REPORT ON INTERNSHIPS AND RESIDENCIES BY THE COUNCIL ON
MEDICAL EDUCATION AND HOSPITALS OF THE
AMERICAN MEDICAL ASSOCIATION

Edward H. Leveroos, M.D., William R. Albus, M.D., and William W. Corbett, M.D.

The approved internship and residency lists are again being published in a special Internship and Residency Number of THE JOURNAL. They include changes in and additions to the lists as of May 1, 1949. Subsequent changes will appear in the Educational Number of THE JOURNAL, scheduled for publication in September.

The 1949 internship list includes data on all hospitals presently approved by the Council for intern training. Approved hospitals are listed geographically followed by information relating to the type of ownership or control, the bed capacity, number of annual admissions, percentage of service cases, type of internship offered, length of program, number of positions available, affiliated assignments, outpatient service, autopsy rate and monthly stipend. In view of the general acceptance of the Cooperative Plan for Appointment of Interns (see Organization Section), the column indicating date of assignment, which appeared in previous lists, has been deleted. The list again indicates hospital affiliation with one or more medical schools, as a major teaching unit or one involving limited assignments for junior or senior clerks. The report which follows summarizes the data presented in the approved lists.

Hospitals approved for residency training are presented according to the various specialty fields. In each category, hospitals are listed alphabetically by city and state, with the name of the chief of service, the volume of teaching material, the number of residencies, date of assignment and monthly stipend. In a number of specialties, training programs are listed as approved for a specified number of years. In these specialties, each board concerned has indicated that it will accept training for the number of years listed, toward satisfying its requirements for certification. Approval in all fields in which specialty boards have been established is extended by the Council in concurrence with the respective American board.

These lists are published annually, primarily for the guidance of physicians seeking internship and residency appointments. The information is made available through the generous cooperation of the approved hospitals, medical schools, specialty boards and the federal services; to them and to the individual administrators, directors, staff physicians and others whose assistance has made possible the publication of these data, grateful acknowledgment is made.

NUMBER OF INTERNSHIPS

Since the publication of last year's Internship and Residency Number, the Council has approved an additional 39 hospitals for intern training. With an equal

number removed from the list during the year, however, the total number approved remained at 807 hospitals. These include 37 under federal control, 118 governmental hospitals other than federal, 15 proprietary, 305 church sponsored and 332 organized on a nonprofit basis. Hospitals engaged in intern training are now listed in all but four states; in addition 1 hospital in the Canal Zone, 1 in Guam, 4 in Hawaii and 6 in Puerto Rico are Council approved. A further analysis of the hospitals approved discloses that 209 are affiliated with medical schools as a major or minor teaching unit, while 598 have organized their programs independently. For purposes of this list, a hospital has been designated as a teaching hospital if its inpatient services are used by junior or senior medical students for clinical clerkships.

These 807 approved hospitals offer a total of 9,124 internships. Of this number 500 internships are offered by the federal services, with the Navy listing 189, the Army 157, the Public Health Service 124, and the other Federal Security Agency hospitals 30. These figures are based on information as of Sept. 1, 1948. While teaching hospitals constituted 25.5 per cent of the total number of hospitals approved, they offered 47.4 per cent of the internships available, or 4,325 of the total number of 9,124 listed.

Three states, New York, Illinois and California, led the rest with 1,537, 676 and 620 internships offered, respectively. Outside the United States, 16 positions were available in the Canal Zone, 46 in Hawaii and 35 in Puerto Rico. Information about the number of positions offered in the one approved hospital in Guam was not available.

INTERNSHIP VACANCIES

The number of hospitals approved for intern training has increased by 10.0 per cent during the past ten years, while the number of internships offered has risen by 16.4 per cent during the same period. The number of medical school graduates meanwhile has not increased proportionately, with the result that approximately 20 per cent of internships offered have remained vacant. The changes in the relations of the number of internships offered to the number of physicians available are presented in table 1.

The teaching hospitals, with 4,325 positions available, reported that 365 of these were not filled as of Sept. 1, 1948, or 8.4 per cent of the total number offered. The nonteaching group, on the other hand, reported 1,446 position vacancies, representing 30.1 per cent of the internships offered. The vacancy percentage for both categories was 19.7 per cent; this compared with 20.5

per cent vacancies reported the previous year. The federal hospitals showed a low vacancy rate with only 21 internships of a total of 500 reported vacant.

While a detailed review of internship vacancies has not been attempted this year, it is evident that there has been little change in the distribution of intern appointments during the past reporting period. The number of vacancies reported in teaching hospitals increased from 348 to 365; those in nonteaching hospitals increased from 1,433 vacancies to 1,446. The apparent inconsistency in the increased number of vacancies and the decreased vacancy percentage reported for 1949 is due to the smaller number of hospitals which furnished data on which the 1948 report was based.

If the number of vacancies, 1,811, reported by approved hospitals during the past year, is deducted from the number of internships offered, 9,124, the difference, 7,313, should represent the number of interns actually assigned. In fact, the 807 approved hospitals reported 7,068 interns on duty as of Sept. 1,

(U. S. Army, U. S. Navy hospitals and those outside the United States not included in 1938-1947 figures.)

1948. The discrepancy between these two figures is due in part to incomplete data furnished by a number of hospitals. A further analysis of internship vacancies, listing the number of hospitals approved, number of internships offered, number of vacancies reported and the percentage of vacancies by states is presented in table 2.

LENGTH OF INTERNSHIP

A significant factor contributing to the increasing shortage of interns in approved hospitals is the decrease in the number of eighteen month and two year internships, with a consequent increase in the annual demand for interns by hospitals which formerly offered appointments only on alternate years. The uncertain situation relative to military service by physicians who have completed a year of intern training may have resulted in fewer hospitals' reorganizing their training programs on a two year basis. Of the total number of hospitals approved, 184 teaching and 547 nonteaching hospitals offered training of one year's duration. Less than 10 per cent of the 807 hospitals approved have in effect programs of more than twelve months' duration, with 33 teaching hospitals and 38 nonteaching offering an

internship in excess of one year. Five hospitals reported varying lengths of training, apparently dependent on the requirements of the interns appointed.

Since the number of interns reported serving in approved hospitals exceeded the number of 1948 graduates by 1,525, it is evident that a significant number of interns are accepting appointments for a second year of training. While graduates of foreign medical schools

*Excludes 12 territorial approved hospitals.

are included in the total number serving, it is estimated that they do not number more than 300 annually. It can be estimated that if one third of the internships presently listed as one year programs could be reorganized on a two year basis, the number of physicians required to fill all approved positions would be approximately equal to the number of interns presently available.

TYPE OF INTERNSHIP

The Council approves three types of internships; rotating, which provide supervised experience in the major clinical divisions, internal medicine, surgery, obstetrics and pediatrics, together with training in anesthesia, pathology and roentgenology; mixed, which provide supervised experience in two or more, but not all of the clinical divisions; and straight, which provide supervised experience in but a single major division, including limited training in one or more of its related subspecialties. The present revision of the Essentials of an Approved Internship contains the statement that the Council considers that the rotating type of internship is most likely to provide the best basic training for either the future general practitioner or the specialist.

Of the 807 conducting approved intern programs, 676 or 83.7 per cent offer rotating internships; 37 hospitals, or 4.6 per cent, provide training in a single department, and 21 hospitals, or 2.6 per cent, offer

Numbers of THE JOURNAL. Beginning this year, a list of twenty federal and twenty nonfederal hospitals reporting the highest autopsy percentages will be given recognition in a separate table. The hospitals so recognized for 1949 are found in table 3. In the nonfederal group, all these hospitals maintained a necropsy rate of 75 per cent or better for the reporting period. In the federal group, two hospitals maintained a 100 per cent rate for the entire year; four hospitals listed in this group, however, fell below the 75 per cent minimum established by the nonfederal hospitals.

STIPENDS

Of those hospitals which offered stipends in addition to maintenance, the salaries ranged from \$9 to \$205 per month in teaching hospitals and from \$8.33 to \$250 per month in the nonteaching group for the past year.

Excluding federal hospitals from consideration, 104 approved hospitals (13 per cent) paid no salary to the intern staff, with 62 teaching hospitals and 42 non-

the mixed type of training. The remaining 73 hospitals, comprising 9.1 per cent of the total number approved, offer a combination of the several types of internship. Straight internship services are limited almost without exception to hospitals affiliated with medical schools. In these instances, the participation by the intern in the general educational activities of the medical school compensates, in a measure, for the more limited experience provided during his training period.

AUTOPSY RATE

The autopsy requirement has been raised to 20 per cent in the new Essentials of an Approved Internship. Of the 807 hospitals presently approved, 761 reported rates in excess of this requirement. The remaining 46 hospitals, which reported rates of 15 to 19 per cent, meeting the previous minimum standard, will be expected to increase the number of necropsies performed to the present required rate. Reevaluation of the hospital's approved status is indicated when it fails to meet the minimum standard for two consecutive years.

In previous years, nonfederal hospitals which reported an autopsy rate of 70 per cent or more were included in a special list in Hospital or Educational

teaching hospitals reporting that they offered maintenance only; 93 teaching hospitals and 232 nonteaching (40 per cent) paid \$50 or less; 21 teaching and 249 nonteaching hospitals (33 per cent) offered amounts from \$51 to \$100 per month, while the remaining 71 (9 per cent) paid amounts in excess of \$100. The 37 government hospitals (5 per cent) stipulated salaries based on government pay scales.

In the teaching group, 87 per cent (155 hospitals) offered stipends of \$50 per month or less. Of the nonteaching hospitals, 316, or 54 per cent, paid salaries in excess of \$50 monthly. There was an appreciable increase in the number of hospitals paying salaries of more than \$100 during the past year, with 51 hospitals so listed in 1948 and 71 hospitals, including 3 teaching, in this category for 1949.

APPROVED RESIDENCY PROGRAMS

Since the publication of the 1948 Internship and Residency Number, two additional certifying boards have been approved by the Council on Medical Education and Hospitals and the Advisory Board for Medical Specialties, namely, the American Board of Proctology, and the American Board of Preventive Medicine and Public Health. The Council now lists approved res-

idencies in eighteen specialties and seven subspecialties, in concurrence with the certifying boards concerned. These specialties include anesthesiology, dermatology and syphilology, internal medicine, neurological surgery, neurology, obstetrics and gynecology, ophthalmology, otolaryngology, orthopedic surgery, pathology, pediatrics, physical medicine, plastic surgery, proctology, psychiatry, radiology, surgery and urology; subspecialties include allergy, cardiovascular diseases, contagious diseases, gastroenterology, malignant diseases, pulmonary diseases and thoracic surgery. Programs listed by the Council as approved are accepted by the respective certifying boards in evaluating a candidate's eligibility for Board examination. In ten of the specialties including dermatology and syphilology, neurological surgery, neurology, obstetrics and gynecology, orthopedic surgery, pathology, pediatrics, psychiatry,

ing, desiring continued approval under the new classification, will be expected to reorganize their programs in conformity with the essentials of an approved residency in general practice.

The approval of hospitals for residency training on a temporary basis, pending inspection, has been discontinued by joint action of the Council and the Advisory Board of Medical Specialties. Hospitals listed as approved on this basis are being inspected as rapidly as possible. Residents under contract in a hospital approved on a temporary basis will not be affected in the event approval is terminated following inspection but will be considered as having served an acceptable residency. Full approval following inspection will be extended to those hospitals which meet the requirements in the specialty contained in the Essentials of Approved Residencies and Fellowships.

NUMBER OF RESIDENCIES

Facilities for residency training in the specialties continue to expand. With few exceptions, the number of hospitals approved for residency training has increased during the past year. Hospitals approved in anesthesiology showed the most marked increase with a 40 per cent rise in the number of hospitals training residents in this specialty. Hospitals conducting residency programs in pathology rose from 328 in 1948 to 404 this year, an increase of 23 per cent. While the number of approved hospitals increased, the number of residencies offered decreased in some instances. Residencies offered in psychiatry were slightly below last year's figure, with 1,618 available in 1948 and 1,595 in 1949, although the number of hospitals approved in this specialty increased from 227 to 253 during the same period. The number of residencies offered in general surgery, 3,543, continued to exceed those in any other specialty. Residencies in internal medicine now number 3,313, an increase of 15 per cent over last year. The total number of residencies offered in all categories increased from 15,172 in 1948 to 17,293 in 1949.

The number of approved hospitals rose from 1,102 in 1948 to 1,187 in 1949, an increase of slightly over 7 per cent. The number of residencies offered, however, increased by 2,121 positions, or a rise of 14 per cent. The average number of positions offered per approved hospital rose from 13.7 to 14.6 residencies. This increase, though slight when considering the individual hospital, is significant when considered in the aggregate. A comparison of the number of hospitals approved for residency training in each specialty and the number of residencies offered in these hospitals for the years 1948 and 1949 is found in table 4.

RESIDENCY PROGRAMS IN FEDERAL HOSPITALS

In addition to their residency programs in civilian hospitals, the Army and Navy conduct training in the specialties in 6 Army hospitals and 9 Navy hospitals, respectively. Residency training is also provided at 12 U. S. P. H. S. hospitals. Including those available in the Veterans Administration, the federal services currently offer 3,322 residencies in all specialty fields, which represent approximately 19 per cent of the total number available. Two of the federal services have also organized residency programs in general practice which are specifically designed to meet the needs of those officers whose duty assignments will include broad responsibilities in the field of general medicine.

* Number of residency programs in 1,187 hospitals approved for residency training.

radiology and urology, programs are listed as approved for a specific number of years of training. In the specialties not listed in this manner, the programs currently are being reappraised to determine whether approval will be continued and, if so, the number of years of training for which approval will be granted. It is anticipated that this information will be made available with the publication of the 1950 Internship and Residency Number.

For the last time this year, hospitals are being listed as approved for "general" or "mixed" residency training. This category is being discontinued with the publication of the 1949 list. In its place, the Council has outlined requirements for a residency in general practice. It should be noted, that hospitals requesting approval under this classification, are expected to meet the same general requirements as do those approved for residency training in the specialties. Hospitals currently listed as approved for general residency train-

APPROVED INTERNSHIPS

Council on Medical Education and Hospitals of the American Medical Association

535 North Dearborn Street, Chicago 10

Revised to May 1, 1949

HOSPITALS, 807 INTERNSHIPS, 9,124

The following general hospitals, investigated and approved by the Council on Medical Education and Hospitals, are considered in position to furnish acceptable intern training in accordance with standards adopted by the American Medical Association. Three types of internships are approved by the Council—rotating, mixed and straight:

- 1. A rotating internship is defined as one which provides supervised experience in internal medicine, surgery, pediatrics, obstetrics and their related subspecialties, together with experience in laboratory and radiologic diagnosis.
- 2. A mixed internship is defined as one which provides supervised experience in two or more, but not in all, of the clinical divisions named.
- 3. A straight internship is defined as one which provides supervised experience in a single department, although it may include limited opportunity for work in a related subspecialty. Straight internships are now approved in internal medicine, surgery, pediatrics, obstetrics (with or without gynecology) and pathology.

Hospitals approved for internships that are used by medical schools for undergraduate clinical clerkships on inpatient services have been identified in the following lists by the symbols X and x. Hospitals have been identified with symbol X when a medical school has indicated that the hospital is a major unit in the school's teaching program. Hospitals have been identified with the symbol x when a medical school has indicated that the hospital is used to a limited extent in the school's teaching program. Certain internships in hospitals designated as teaching hospitals may not provide for assignments to teaching services. Other internships may provide for only a portion of the internship period being spent on teaching services. Prospective interns desiring specific information concerning internship assignments to teaching services in a hospital are advised to communicate with the dean of the medical school with which the hospital is affiliated. Medical school affiliations are indicated by footnotes 10 to 80 placed immediately after the symbol X or x. The list of medical schools appears on page 171.

The plus (+) sign indicates additional approval for residencies in specialties, as shown in the Council's list of Approved Residencies and Fellowships for Veteran and Civilian Physicians. The hospitals approved for intern training are likewise accredited for general residencies which represent general house staff assignments following the internship. This category will be discontinued effective July 1, 1950. In the interim, hospitals approved for general residency training will be reappraised on the basis of the recently adopted requirements for residency training in general practice.

HOSPITALS APPROVED FOR INTERNSHIPS IN THE DOMINION OF CANADA

For the benefit of graduates of approved medical colleges who desire an internship in Canada, the Council on Medical Education and Hospitals of the American Medical Association has declared that hospitals which conform to the standards of the Canadian Medical Association should be regarded as giving an internship equivalent in educational value to that offered by hospitals in the United States approved for intern training by the Council. It is understood, however, that this statement applies only to hospitals that are unqualifiedly "Approved" under the Canadian plan and does not apply to that group referred to as "Commended."

The following list of hospitals, revised to Jan. 1, 1949, has been furnished by the Canadian Medical Association.

Name of Hospital	Location	Name of Hospital	Location	Name of Hospital	Location
Camp Hill Hospital.....	Halifax, N. S.	Hamilton General Hospital.....	Hamilton, Ont.	Hotel Dieu of St. Joseph.....	Windsor, Ont.
Victoria General Hospital.....	Halifax, N. S.	St. Joseph's Hospital.....	Hamilton, Ont.	Children's Hospital.....	Winnipeg, Man.
St. John General Hospital.....	St. John, N. B.	St. Joseph's Hospital.....	London, Ont.	Deer Lodge Hospital.....	Winnipeg, Man.
Hospital du St. Sacrement.....	Quebec, Que.	Victoria Hospital.....	London, Ont.	Misericordia Hospital.....	Winnipeg, Man.
Hospital Dieu de Quebec.....	Quebec, Que.	Westminster Hospital.....	London, Ont.	Winnipeg General Hospital.....	Winnipeg, Man.
Hospital of the Infant Jesus.....	Quebec, Que.	Oshawa General Hospital.....	Oshawa, Ont.	St. Boniface Hospital.....	Man.
Jeffrey Hale's Hospital.....	Quebec, Que.	Ottawa Civic Hospital.....	Ottawa, Ont.	Regina Grey Nun's Hospital.....	Regina, Sask.
Veterans Hospital.....	Quebec, Que.	Ottawa General Hospital.....	Ottawa, Ont.	Regina General Hospital.....	Regina, Sask.
Children's Memorial Hospital.....	Montreal, Que.	Hotel Dieu Hospital.....	Kingston, Ont.	St. Paul's Hospital.....	Saskatoon, Sask.
Herbert Reddy Mem. Hospital.....	Montreal, Que.	Kingston General Hospital.....	Kingston, Ont.	Saskatoon City Hospital.....	Saskatoon, Sask.
Homeopathic Hospital.....	Montreal, Que.	Christie Street Hospital.....	Toronto, Ont.	Calgary General Hospital.....	Calgary, Alta.
Hospital Notre Dame.....	Montreal, Que.	Hospital for Sick Children.....	Toronto, Ont.	Colonel Belcher Hospital.....	Calgary, Alta.
Hospital Ste. Jeanne d'Arc.....	Montreal, Que.	Mount Sinai Hospital.....	Toronto, Ont.	Holy Cross Hospital.....	Calgary, Alta.
Hospital Ste. Justine.....	Montreal, Que.	St. Joseph's Hospital.....	Toronto, Ont.	Edmonton General Hospital.....	Edmonton, Alta.
Hotel Dieu de Montreal.....	Montreal, Que.	St. Michael's Hospital.....	Toronto, Ont.	Misericordia Hospital.....	Edmonton, Alta.
Hospital Ste. Luc.....	Montreal, Que.	Toronto East General Hospital.....	Toronto, Ont.	Royal Alexandra Hospital.....	Edmonton, Alta.
Jewish General Hospital.....	Montreal, Que.	Toronto General Hospital.....	Toronto, Ont.	University of Alberta Hosp.....	Edmonton, Alta.
Montreal General Hospital.....	Montreal, Que.	Toronto Western Hospital.....	Toronto, Ont.	St. Paul's Hospital.....	Vancouver, B. C.
Queen Mary Veterans Hospital.....	Montreal, Que.	Wellesley Hospital.....	Toronto, Ont.	Shaughnessy Hospital.....	Vancouver, B. C.

APPROVED RESIDENCIES AND FELLOWSHIPS

Council on Medical Education and Hospitals of the American Medical Association
355 North Dearborn Street, Chicago 10

Revised to May 1, 1949

Hospitals, 1,187; Assistant Residencies, Residencies and Fellowships, 17,293

The following services are approved by the Council on Medical Education and Hospitals as meeting the requirements of the Essentials of Approved Residencies and Fellowships. In those specialties in which certifying boards have been established approval is extended in concurrence with the Board concerned. The number of years of training for which approval has been granted is indicated in the column, "Length of Approved Program (years)." Residencies in which this designation does not appear have been approved without specifying the number of years for which they are accredited.

The (*) indicates hospitals approved for intern training. All hospitals included in the internship list are also accredited for general residency training. This category will be replaced by the residency in general practice in the next Internship and Residency Number.

The (†) represents temporary approval, pending formal inspection, in accordance with the plan announced in THE JOURNAL, March 2, 1946, p. 586. Granting of approval on this basis has been terminated by action of the Council and the Advisory Board for Medical Specialties. Hospitals temporarily approved prior to this action currently are being inspected to determine whether or not approval should be continued and, if so, the number of years of training for which they will be accredited.

16. OTOLARYNGOLOGY

(See Ophthalmology)

17. PATHOLOGY

The services listed below are approved by the Council and the American Board of Pathology. These programs presently are being reappraised in accordance with the place of training announced by the Board on February 1, 1949.

Services which have been evaluated on the basis of training in the two categories, pathologic anatomy and clinical pathology, are designated as follows: pathologic anatomy only—a; clinical pathology only—c; pathologic anatomy and clinical pathology—p. Training in hospitals which are not so designated in this list will be evaluated by the Board on an individual basis (at the time of application for certification).

Hospitals, 403; Assistant Residencies and Residencies, 1,017

24. RADIOLOGY

The following services are approved by the Council and the American Board of Radiology. Prior to July 1, 1950, these services will be reviewed in collaboration with the American Board of Radiology to determine whether approval will be continued beyond that date and to determine further the number of years of training in individual hospitals which the Board will continue to accept as preparation for its certification examination.

25. SURGERY

The services listed below are approved by the Council and the American Board of Surgery until July 1, 1950, as previously announced (Internship and Residency Number, The Journal, May 1, 1948). These services presently are being re-appraised in accordance with a plan of residency training to be announced by the American Board of Surgery.

A revised list of approved residencies in Surgery will appear in the Educational Number of The Journal, scheduled for publication in the early fall. Physicians planning to apply for residency training in surgery to begin on or after July 1, 1950, should consult this list in making application for appointment.

Hospitals, 562; Assistant Residencies and Residencies, 3,543

25. SURGERY

The services listed below are approved by the Council and the American Board of Surgery until July 1, 1950, as previously announced (Internship and Residency Number, The Journal, May 1, 1948). These services presently are being re-appraised in accordance with a plan of residency training to be announced by the American Board of Surgery.

A revised list of approved residencies in Surgery will appear in the Educational Number of The Journal, scheduled for publication in the early fall. Physicians planning to apply for residency training in surgery to begin on or after July 1, 1950, should consult this list in making application for appointment.

Hospitals, 562; Assistant Residencies and Residencies, 3,543

25. SURGERY

The services listed below are approved by the Council and the American Board of Surgery until July 1, 1950, as previously announced (Internship and Residency Number, The Journal, May 1, 1948). These services presently are being re-appraised in accordance with a plan of residency training to be announced by the American Board of Surgery.

A revised list of approved residencies in Surgery will appear in the Educational Number of The Journal, scheduled for publication in the early fall. Physicians planning to apply for residency training in surgery to begin on or after July 1, 1950, should consult this list in making application for appointment.

SATURDAY, MAY 14, 1949

REVISION OF ESSENTIALS OF AN APPROVED INTERNSHIP

In November 1948 the Council on Medical Education and Hospitals completed the first major revision of the "Essentials of An Approved Internship" since 1942. The revision was ratified by the House of Delegates at the St. Louis Interim Session, and its provisions are now in effect. A careful study of the new "Essentials" is indicated so that hospitals may adjust their programs to the present requirements, if necessary, and thus continue to qualify for internship approval.

With the exception of the necropsy data, the quantitative requirements have not been changed appreciably. Hospitals with capacities of 100 beds and over, maintaining an average daily census of 85 patients and an annual admission rate of 2,500, are eligible for approval. The necropsy rate has been raised from 15 to 20 per cent. This increase is consistent with the generally accepted principle that a hospital's necropsy rate constitutes a reliable gage of the staff's interest in scientific advancement. While the necropsy rate was raised, the quantitative requirement of 36 necropsies per annum was eliminated, so as not to penalize a hospital in which a relatively low number of deaths occur.

The Council in its present "Essentials" has reemphasized the importance of a well organized program for intern training, stating that internships arranged merely to provide hospitals with resident personnel to assist in the clinical work of the hospital cannot be approved. The Council has suggested that the appointment of a director of intern education on a full time or part time basis may be desirable in hospitals in which the members of the staff are unable to devote the necessary time to the careful planning and supervision of the details of the internship program. The attending staff is not to be relieved of responsibility for teaching; rather, the director will correlate the activi-

ties of the several services and supervise the over-all program. The ultimate responsibility for training the intern lies with the staff through instruction at the bedside, in the operating and delivery rooms and in other daily contacts. The "Essentials" suggests that an orientation period be arranged at the beginning of his service during which the staff should acquaint the new intern with the administrative and professional organization of the hospital and introduce him to the ancillary services of the hospital which are available to assist in the care and treatment of the patient.

The "Essentials" include the statement that the Council believes that a well organized rotating internship is likely to provide the best basic training for either the future general practitioner or the specialist. This type of training provides for adequate experience in the four major clinical divisions. Too frequent a rotation of assignments or assignment to more than one service at a time is not considered desirable. The Council recommends that at least three months be devoted both to internal medicine and to surgery and states that any assignment of less than two months' duration is unsatisfactory. While the majority of internships presently approved are of one year's duration, longer periods of service are considered preferable, since they permit a more satisfactory educational program and allow the intern sufficient time in which to be trained adequately to assume increasing responsibility in various fields of medicine.

For the first time, the "Essentials" provide a method for determining the number of interns to be appointed. The bed capacity of the hospital is used as a basis, with a range of 15 to 25 beds per intern recommended. Consideration should be given to the amount of responsibility required of the intern for work in outpatient departments, emergency services, laboratories or similar assignments in determining the ratio which the hospital may wish to use. While the Council does not establish a specific number of interns to be appointed by approved hospitals, the hospitals will, no doubt, comply with this requirement in organizing their programs.

Hospitals approved for intern training are currently being reappraised on the basis of these new "Essentials." Probably the Council will reconsider the approved status of the hospitals which fail to meet the quantitative requirements or which have not organized a training program that measures up to the new standards established. Council approval is granted on a year to year basis and may be withdrawn at any time that a hospital ceases to meet one or more of the requirements set forth. Approval may also be withdrawn from hospitals in which the intern program has not been in operation for a period of two consecutive years.

The provisions of the new "Essentials" have been called to the attention of all hospitals approved by the Council. Development of internship programs on the

basis of the requirements set forth in the present revision will result in a higher level of intern training, particularly in hospitals that have allowed the educational aspects of the internship to become subordinate to the service requirements.

EARLY RISING AFTER SURGICAL OPERATION

Early rising after operation was first advocated in this country by Emil Ries¹ of Chicago as early as 1899. Patients of Dr. Ries were made to sit in a chair for ten minutes on the second postoperative day regardless of the extent of the surgical procedure. The method was adopted somewhat later by Dr. H. M. Richter, also of Chicago, by the Mayos and by numerous other American surgeons. The Germans usually credit Heinrich Braun with priority in this field. At the thirty-seventh congress of the German Surgical Society in 1908 Kümmel and Krönig spoke enthusiastically of the method. A further impetus to early postoperative ambulation in this country was given by the report of Leithauser and Bergo,² in which the authors stated that pulmonary or vascular complications, dehiscence, hernia, thrombophlebitis or other serious complications failed to occur in a series of 436 operative cases. The nature of the intervention in 330 cases of this series was of a type considered minor, and in only 66 cases reported by them was the operation of the type considered major.

The advocates of early rising stressed, as pointed out in an early editorial in *THE JOURNAL*,³ the beneficial influence of the method on the pulmonary and intestinal functions; also on the function of micturition as well as on the mental state of the patient.

A recent report by Blodgett⁴ from Peter Bent Brigham Hospital offers an evaluation of both advantages and limitations of the method. Early rising has been practiced in this hospital since 1942. Noted among the advantages was a more rapid return to normal strength and activity and a better outlook and morale in the patient. When men were allowed to stand to void, a lowered incidence of urinary retention was noted. Early ambulation prevented the definite loss of strength that occurs with continued bed rest and shortened the period of convalescence. For a study of the incidence of postoperative complications, a series of patients was chosen in which the incidence of such complications is highest. The operations included major intra-abdominal operations and herniorrhaphies of various types. The test series consisted of 504 cases

in which early rising was practiced and a control series of 680 cases, in all of which the patients remained in bed for at least seven days after operation. Particular attention was paid to the incidence of atelectasis, phlebitis, wound infection and wound disruption. The incidence of atelectasis in early risers was 6.3 per cent and among late risers 6.2 per cent, a difference which is statistically insignificant. Thrombophlebitis of the deep veins in the legs occurred in 1.9 per cent in the late rising groups as compared with 2 per cent in the early rising group. With regard to wound infection, all that could be said was that early rising did not increase it, since the incidence was 2.8 per cent in the early rising group as compared with 4.4 per cent in the late rising group. Wound disruption after intra-abdominal operations in the late rising group occurred in 2.7 per cent and in 1.2 per cent in the early rising group. A follow-up of 421 herniorrhaphies for some six months to six years revealed a rate of recurrence of 4 per cent for the late risers in the group of indirect inguinal hernias and of 3.1 per cent among the early risers. The recurrence rate for direct hernia was 12.5 per cent in the late risers as compared with 9.4 per cent in the early risers.

These statistical data, according to Blodgett, do not show that early rising reduces the incidence of atelectasis or phlebitis, but they do show that early rising is without apparent ill effect on wound healing, wound infection or wound disruption and on the recurrence rate in hernias. The advantages of the method are to be seen in the prevention of the onset of weakness, in diminution of wound pain, acceleration of convalescence and reduction of the required nursing care.

DUPLEX MUMPS ANTIGEN

In 1942 Enders and Cohen¹ of the Department of Bacteriology, Harvard University, described a complement fixation test for mumps. The test employed a suspension of parotid glands from monkeys infected with mumps virus. The test was found useful in the diagnosis of some unusual manifestations of mumps infection, such as meningoencephalitis in the absence of parotitis.² Positive complement fixation reactions were obtained with the serums of 42 per cent of persons without previous history of mumps, which was interpreted as a measure of the frequency of inapparent infection with the mumps virus.

Habel,³ Levens⁴ and others subsequently adapted the mumps virus to the chick embryo, thus furnishing a cheaper and more readily available source of mumps antigen. Subsequently Henle and others⁵ of the

Department of Pediatrics, University of Pennsylvania, showed that the chick embryo antigen consists of a mixture of two serologically distinct complement fixation factors. One of these factors ("V antigen") is closely linked with the mumps virus and is found predominantly in the allantoic and amniotic fluids of the virus-infected chick embryo. The second or soluble factor ("S antigen") is found mainly in the infected embryonic tissues such as the allantoic and amniotic membranes. The two antigens can be separated by high speed centrifugation and sharply differentiated by serum reactions. Antibody against V can be removed from a human convalescent serum by absorption with V antigen, leaving most of the S antigen in the serum. Conversely, absorption with S antigen leaves most of the antibodies against V in the serum.

Application of the two antigens to human serums taken at various stages of mumps infection are currently reported.⁶ In order to study the development of antibodies to the two antigens, serums of volunteers were titrated at intervals following experimental exposure to an oral spray containing virulent or attenuated mumps virus. In a typical experiment, 2 volunteers were sprayed with a virulent virus. In both cases, anti-S reactions were demonstrated by the twelfth day, increasing to a maximum by the eighteenth to the twentieth day. Demonstrable reactions did not appear against the V antigen till five days later in the 1 case in which parotitis developed, but appeared almost simultaneously with the S antibody in the second volunteer, who remained apparently well. The two antibodies increased to approximately the same titer by the thirtieth day. Similar delayed formation of anti-V antibody was noted in volunteers inoculated with attenuated virus, in none of whom did parotitis develop. In some of these cases the anti-V titer remained at a very low level till the end of the test (thirty-five days).

Serums from cases of the natural disease were titrated periodically only after the appearance of symptoms. During the first week of the disease the serums usually show relatively high titer anti-S reactions, with low titer or negative anti-V reactions. During the second and third weeks the two reactions tend to become equal. After this both reactions decrease in titer, the S reaction somewhat faster than the V reaction. With serums collected six months or more after the infection, anti-V exceeds anti-S, in many cases anti-S being absent. Several years after the infection no detectable antibodies may be present except those against the V antigen.

After subcutaneous vaccination in skin testing with inactivated (irradiated) mumps virus, antibodies against both antigens may develop, those against V antigen being invariably of a higher titer than the anti-S titer. Frequently only anti-V is formed.

The Henles believe that the use of both V and S antigens will prove helpful in diagnosis, particularly in the absence of parotitis. A theory has not yet been suggested as to the origin and nature of the S antigen. Demonstration of the dual antigenicity of the mumps virus is a challenge to conventional theories in other virus infections.

Current Comment

THE INTERN SHORTAGE

In last year's Internship and Residency Number (THE JOURNAL, May 1, 1948), a survey of hospitals approved for intern training indicated that 20.5 per cent of internships offered by these hospitals were not filled. The highest proportion of vacancies was found in hospitals of 150 beds or less, particularly in those classified as nonteaching. The situation regarding intern vacancies remained relatively unchanged this year, with approved hospitals reporting 1,811 positions vacant as of Sept. 1, 1948, representing 19.7 per cent of those offered. In considering the discrepancy between the number of internships offered and the number of physicians available for these positions, it should be remembered that the former figure measures the demand for interns by approved hospitals and not of necessity the actual need. The Council, in the "Essentials of an Approved Internship," points out that a hospital should appoint interns in such numbers that there will be an average for the hospital of 15 to 25 beds per intern; it does not fix a specific number of internships for which a hospital is approved. Accordingly the statement that there are upwards of 9,000 "approved" internships is in a sense inaccurate. More correctly stated, there are 807 approved hospitals which offer 9,124 internships. These same hospitals next year might well decide to offer 10,000 internships or 8,000 as the case may be, thereby increasing or decreasing the relative shortage of interns. Estimates indicate that 1,380 hospitals can meet the quantitative requirements of the "Essentials of An Approved Internship" and hence have the potential to develop a program which will meet the standards for approval by the Council. If all these hospitals were to become approved, 16,000 interns would be required to staff them. Such a supply of interns is not presently available, nor is it likely to be in the near future. The majority of these hospitals, accordingly, will have to continue to render the same high type of patient care without relying on interns. As a step toward assuring the prospective intern of a satisfactory educational experience and to eliminate, as far as it can, the present situation relative to intern vacancies, the Council is now engaged in a survey of all hospitals approved for intern training. Undoubtedly the Council will remove from its list any hospital which does not meet minimum requirements for approval or which fails to provide a true educational experience for the physician during this important phase of his training.

6. Henle, G.; Harris, S., and Henle, W.: J. Exper. Med. 88:133, (July) 1948.

THE GENERAL PRACTICE RESIDENCY

The "Essentials of Approved Residencies and Fellowships" as revised by the Council last December includes for the first time a residency specifically designed for the physician who intends to enter general practice. Heretofore the Council had approved hospitals for general or mixed residencies, which were training programs rather loosely organized, for the purpose of providing additional experience following the internship. All hospitals with approved intern programs were approved for general residency training under the previous "Essentials." In addition, some seventy hospitals which were unable to meet the requirements for training interns were approved for general residency training only. The listing of these hospitals under a "General Residency" category will be discontinued after the publication of this Internship and Residency Number. Hospitals previously approved under the former classification and desiring continuing approval will be expected to reorganize their programs in accordance with the new requirements. A hospital seeking approval for residency training in general practice must meet the same general requirements as does a hospital offering residency training in a specialty. Training programs of this type have already been developed in a number of teaching hospitals. One of the federal services has also set up a residency at several of its larger training centers in conformity with the new classification and has already begun to train physicians in this field. Hospitals which are able to meet the requirements for approval should give consideration to the broadening of the scope of their educational activities by offering a residency of this type. In establishing the residency in general practice, the Council recognized the demand for additional training at the graduate level by physicians who do not intend to limit their work to a specialty. The type of experience offered by the general residency was often not at a level which would attract the applicant who wanted supervised training commensurate with his experience and ability. Of necessity, these men sought appointments to residencies in the specialty fields, although many might well have been attracted to a broader type of training had more adequate facilities been available. The residency for general practice will provide supervised training in the major clinical divisions of internal medicine, surgery, obstetrics-gynecology and pediatrics, as well as in the auxiliary services of anesthesiology, pathology and radiology. On the completion of a residency of this type, the physician should be better prepared to meet the professional demands of the community in his role as the "family doctor." The program has not been developed with the thought that one or another of the specialty boards will accept it as meeting in part its training requirements. Such action would defeat the purpose of this residency, which is to encourage more young physicians to enter the field of general practice. The Council believes that this may be accomplished in part by providing facilities for training which will give the young family doctor the assurance that he has been fully trained to meet the demands on his professional competence in a large field.

MORE CHIROPRACTORS

The fountainhead of chiropractic is the school in Davenport, Iowa. At present some 1,700 young men who served in the armed forces during the war are spending three years of six months each under the GI Bill of Rights learning about chiropractic in Davenport. The federal government is paying \$500 tuition per year for their training. The total amount for tuition is thus 1,700 times \$1,500, which is \$2,550,000. In many of the states the young men who graduate will be unable to practice the peculiar "art" and its salesmanship that they learn. Certainly chiropractic is not a science, because nothing resembling scientific evidence can be mustered to indicate that the practice of chiropractic is based on sound anatomy, physiology, pathology or any other basic medical science. In many states the chiropractors have to pass a basic science examination in order to qualify for a license. Reports indicate that a recent basic science examination in Iowa resulted in the appearance of some 500 of these young men, who sat crowded together in a room where they were given the kind of basic science examination that defeats the purpose of such legislation. One might philosophize at some length on the kind of legislation and administration under political control that results in this type of expensive farce. The facts themselves are an indictment.

SMALLPOX VACCINATION AND PREGNANCY

The report by Marjorie T. Bellows and co-workers¹ is a by-product of a study of the relation of infections and illnesses occurring during pregnancy to the incidence of abortions, stillbirths, congenital malformations, prematurity and infant deaths. All women less than four months pregnant at admission to the antepartum clinic of the Sloane Hospital for Women, in New York City, were included in the study, which was begun Oct. 1, 1946. The occurrence of 9 cases of smallpox in the spring of 1947 in New York City and the subsequent mass vaccination of an estimated 80 per cent of the total population afforded an opportunity to evaluate the effect of smallpox vaccination on the outcome of pregnancy. Of 893 pregnant women observed, 720 were vaccinated and 173 were not vaccinated. Three per cent of all pregnancies resulted in congenital malformations. The rates for women not vaccinated and for those who had primary reactions to vaccination were about equal and somewhat lower than the rates for women who did not have reaction or who had an accelerated reaction. The incidence of stillbirths varied from 2.3 per cent among women with primary takes to 4.3 per cent among women with accelerated reactions. The differences observed were not statistically significant. The infant death rates varied from 0.6 per cent among the nonvaccinated to 1.7 per cent among those with primary takes, the differences again not being significant. The authors conclude that smallpox vaccination during pregnancy does not increase the incidence of congenital malformations, stillbirths, abortions or infant deaths.

1. Bellows, M. T.; Hyman, M. E., and Merritt, K. K.: Effect of Smallpox Vaccination on the Outcome of Pregnancy, *Pub. Health Rep.* 64: 319-323 (March 11) 1949.

ORGANIZATION SECTION

Official Notes

REFERENCE COMMITTEES OF HOUSE OF DELEGATES

Dr. F. F. Borzell, Speaker of the House of Delegates, has appointed the following reference committees to serve in the House of Delegates at the Atlantic City Session in June:

SECTIONS AND SECTION WORK:

Roy B. Henline, *Chairman*, Section on Urology
J. W. Bird, Maryland
Charles H. Phifer, Illinois
John M. Porter, Kansas
Charles T. Stone, *Section on Internal Medicine*

RULES AND ORDER OF BUSINESS:

Albert F. R. Andresen, *Chairman*, New York
L. Howard Schriver, Ohio
Charles R. Rountree, Oklahoma
John F. Conway, New Mexico
E. Roger Samuel, Pennsylvania

REPORTS OF BOARD OF TRUSTEES AND SECRETARY:

Thomas A. Foster, *Chairman*, Maine
Warren L. Allee, Missouri
Allen H. Bunce, Georgia
William F. Costello, New Jersey
William M. Skipp, Ohio

MEDICAL EDUCATION:

B. R. Kirklin, *Chairman*, Section on Radiology
W. P. Anderton, New York
Lowell S. Goin, California
H. G. Hamer, Indiana
Charles L. Shafer, Pennsylvania

LEGISLATION AND PUBLIC RELATIONS:

William Bates, *Chairman*, Pennsylvania
F. J. L. Blasingame, Texas
Leo G. Christian, Michigan
Walter G. Phippen, Massachusetts
H. Gordon MacLean, California

HYGIENE AND PUBLIC HEALTH:

Deering G. Smith, *Chairman*, New Hampshire
W. Palmer Dearing, Public Health Service
Stephen E. Gavin, Wisconsin
Scott L. Smith, New York
Felix J. Underwood, Mississippi

AMENDMENTS TO CONSTITUTION AND BY-LAWS:

William D. Stovall, *Chairman*, Wisconsin
Ivan Fawcett, West Virginia
James P. Kerby, Utah
William A. Hyland, Michigan
B. E. Pickett Sr., Texas

REPORTS OF OFFICERS:

F. J. Pinkerton, *Chairman*, Hawaii
J. B. Lukins, Kentucky
George E. Earl, Minnesota
J. Stanley Kenney, New York
Charles J. Kickham, Massachusetts

CREDENTIALS:

H. B. Everett, *Chairman*, Tennessee
E. P. Flood, New York
Carl A. Lincke, Ohio
Raymond F. Peterson, Montana
Charles F. Strosnider, North Carolina

INDUSTRIAL HEALTH:

William L. Estes Jr., *Chairman*, Pennsylvania
Wyman D. Barrett, Michigan
Warren W. Furey, Illinois
Edward H. McLean, Oregon
Carl A. Grote, Alabama

EXECUTIVE SESSION:

John W. Cline, *Chairman*, California
R. H. Hayes, Illinois
Thomas P. Murdock, Connecticut
Howard K. Petry, Pennsylvania
Hugh P. Smith, South Carolina

MISCELLANEOUS BUSINESS:

Mather Pfeiffenberger, *Chairman*, Illinois
George Braunlich, Iowa
William R. Brooksher, Arkansas
Andrew A. Eggston, New York
Hoyt B. Woolley, Idaho

THE NATIONAL CONFERENCE OF COUNTY MEDICAL SOCIETY OFFICERS

Sunday, June 5, 1949, Atlantic City, N. J.

MORNING SESSION

ROSE ROOM, HOTEL TRAYMORE

REGISTRATION—9:00 A. M.

Call to Order: A. M. MITCHELL, M.D., *Chairman*, Terre Haute, Ind.

Address of Welcome: E. L. HENDERSON, M.D., *Chairman*, Board of Trustees, American Medical Association, Louisville, Ky.

PANEL I—9:30 A. M.

IS YOUR SOCIETY PREPARED TO CARE FOR EMERGENCY CALLS?

Moderator: MR. THEODORE WIPRUD, Secretary, Medical Society of the District of Columbia, Washington, D. C.

A. An Effective Emergency Call Plan.

RALPH E. SCHMIDT, M.D., *Chairman*, Medical Service and Public Relations Committee, Erie County Medical Society, Erie, Pa.

B. Plans for a Small County Society.

JAMES A. BIGGINS, M.D., *Chairman*, Committee on Economics and Public Relations, Mercer County Medical Society, Sharpsville, Pa.

C. The 24-Hour Telephone Answering Service.

MR. J. RICHARD CONNELLY, Assistant Secretary, Medical Society of the District of Columbia.

Open Discussion

PANEL II—10:30 A. M.

DOES YOUR SOCIETY HAVE AN INDIGENT MEDICAL CARE PLAN?

Moderator: W. ANDREW BUNTEN, M.D., Cheyenne, Wyo.

A. The Maryland Medical Care Program.

DEAN W. ROBERTS, M.D., Chief, Bureau of Medical Services, Maryland State Health Department, Baltimore.

B. The Washington State Program.

MR. RALPH W. NEILL, Executive Secretary, Washington State Medical Association, Seattle.

C. A County Society Plan.

MR. MARTIN BAKER, Executive Secretary, Sedgwick County Medical Society, Wichita, Kan.

Open Discussion

PANEL III—11:30 A. M.

IS YOUR SOCIETY READY FOR THE NATIONAL
EDUCATION CAMPAIGN?

Moderator: FRANK J. HOLROYD, M.D., Princeton, W. Va.

A. Practical Methods of Organizing for the Campaign.

IRA H. LOCKWOOD, M.D., Chairman, Public Policy and Relations Committee, Jackson County Medical Society, Kansas City, Mo.

B. Assuming Responsibility for Community Health Problems.

MR. ROLLEN WATERSON, Executive Secretary, Alameda County Medical Association, Oakland, Calif.

C. The Preparation and Distribution of Literature.

MR. HUGH BRENNEMAN, Public Relations Counsel, Michigan State Medical Society, Lansing, Mich.

D. Coordination with the American Medical Association National Education Campaign.

A one hour question and answer period devoted to the American Medical Association National Education Campaign with representatives of Whitaker and Baxter present to assist the moderator.

EVENING SESSION

TRIMBLE ROOM, 8:00 P. M., CLARIDGE HOTEL

A. M. A. National Education Campaign.

MR. CLEM WHITAKER, Director, American Medical Association's National Education Campaign.

A Senator Views the Health Problem.

The Honorable JOHN L. MCCLELLAN, United States Senator, Camden, Ark.; Member of the "Hoover" Commission on Organization of The Executive Branch of the Government.

AIR TRAVEL DIRECT TO ATLANTIC CITY

In the item on air travel, *THE JOURNAL*, April 23, p. 1156, there was failure to mention that Eastern Air Lines is the only air line with direct service to Atlantic City—no necessity to change to a bus or limousine for a two hour trip from Philadelphia. Eastern Air Lines serves the greater portion of the eastern half of the United States. For further information concerning Eastern Air Lines service to Atlantic City for the annual meeting of the American Medical Association June 6-10, please communicate with E. M. Van Duzer, Advertising and Public Relations Department, Eastern Air Lines Building, 10 Rockefeller Plaza, New York 20, N. Y.

RADIO PROGRAM TO BE CONTINUED
THROUGH SUMMER

Plans are being developed by the Bureau of Health Education for extension of the weekly national radio program of the American Medical Association, authorized recently by the Board of Trustees. As a result of that authorization, the series will be continued through the summer and well into the fall season. Customarily, the annual series has terminated in the latter part of June. The fifteen minute program that is carried over the National Broadcasting Company network, with more than one hundred stations presenting it locally, goes on the air at 3 p. m., central standard time, every Saturday. Introduction by Dr. W. W. Bauer of a special technic in which participants are picked up from widely separated sections of the country has met with much favorable comment. Excellent cooperation has been extended in this by state medical society officials. This procedure will be used at varying intervals throughout the series.

TELEVISION PROGRAMS

The Bureau of Health Education of the American Medical Association is presenting a series of brief television health education programs weekly over station WGN-TV, Chicago. Five minutes of a half hour program sponsored by an electrical equipment manufacturing company are devoted to consideration of subjects of interest primarily to women. Presentations have included obesity, alcoholism, rheumatism and heart disease, and among future programs will be skin disorders, child health, blood pressure and problems of aging. Visual aids employed have included charts, models and portions of motion pictures.

SURVEY OF SCHOOL HEALTH SERVICES

The secretary of each local medical society will soon receive in the mail a questionnaire on school health services in his community. The American Medical Association in cooperation with the United States Office of Education is making a survey of school health services through its Bureau of Health Education.

The United States Office of Education in Washington will concurrently query the schools. Two different questionnaires which supplement and reinforce each other and do not contain duplicate questions are being used. The information requested is needed to determine present strengths and weaknesses in school health services, to indicate needs and to point up action for the future. The questionnaire has been tested prior to printing and all unnecessary questions have been eliminated.

This project, which is actually an outgrowth of the National Conference on Physicians and Schools sponsored by the American Medical Association in 1947 at Highland Park, Ill., provides tangible evidence of the desire of the medical profession to cooperate in worth while projects designed to improve the health of school age children, as part of the American Medical Association's twelve point program for the advancement of medicine and public health.

WORCESTER (MASS.) INTERNS AND RESIDENTS PROTEST NATIONALIZED MEDICINE

The interns and residents of the Worcester City Hospital presented to Dr. N. S. Scarcello, Chairman of the Public Relations Committee of the Worcester District Medical Society, a letter relative to a recent statement made in *The Interne*, a magazine said to be the publication of the interns' organization. Apparently this organization includes relatively few interns and residents but claims to represent all.

Dr. Scarcello points out that the Worcester interns and residents oppose the statements made in *The Interne*, but they feel and he agrees that their side of the story will not be published by *The Interne*.

As their spokesman Dr. Scarcello forwards a copy of their letter plus the signatures of the interns and residents. The letter follows:

Association of Internes and Medical Students
New York, N. Y.
Gentlemen:

We, the undersigned, house officers at the Worcester City Hospital, wish to express our disapproval of the report on the A.I.M.S. Convention 1948, published in the February 1949 issue of *Interne*. We are particularly concerned with the resolution supporting a "prepaid national government-sponsored health program."

It is our considered judgment that a government-sponsored health program would be detrimental to the adequate medical care of the American people.

The endorsement of the National Health Program as expressed at the convention is not in accordance with the unanimous opinion of the house officers at this hospital. We feel that in all probability it cannot be the unanimous or even majority opinion of the house officers and medical students throughout the country.

Washington Letter

(From a Special Correspondent)

May 9, 1949.

Expansion of Voluntary Hospital System Urged

Testimony supporting greater federal appropriations for subsidization of construction of voluntary hospitals and for medical research was presented in Washington the week of May 2, opening a series of public health hearings in Congress. Witnesses appearing before subcommittees of the Senate Labor and Public Welfare Committee included Dr. George F. Lull, Dr. Albert D. Kaiser, Dr. R. H. Hutcheson, Dr. William G. Lennox and Surgeon General L. A. Scheele.

May 16 has been scheduled for the opening of extended hearings on broad health legislation, including compulsory sickness insurance as proposed by President Truman, by the Senate health subcommittee. The four bills on which testimony will be heard are: S. 1106, for supplying drugs and laboratory diagnostic services to the medically indigent; S. 1456 and S. 1581, substantially alike in principle and which provide for federal support of state-controlled medical care assistance on a voluntary basis, and S. 1679, the Truman plan for compulsory sickness insurance.

Testifying May 4 before the special Senate subcommittee of which Senator Lister Hill is chairman, Dr. Lull explained that an American Medical Association legislative committee has endorsed the intent and purposes of the hospital expansion bill (S. 614) and further action will be considered by the House of Delegates at the Atlantic City meeting.

Dr. Hutcheson, in his dual capacity as Tennessee State Health Commissioner and president of the Association of State and Territorial Health Officers, expressed approval of S. 614. He recommended, however, that the proposed law contain no rigid formula on administrative costs but, instead, that the Surgeon General have authority to determine what the figure should be, state by state.

Passage of the measure, sponsored by Senators Hill, Taft, Smith and Ellender, also was urged by Drs. Kaiser and Scheele. The former, Rochester (N. Y.) health officer and executive secretary of the Rochester Regional Hospital Council, said enactment of S. 614 would promote development of regional hospital planning. Dr. Scheele stated that it would "mark an important step forward in our nationwide effort to provide adequate hospital facilities and services for the people of this country."

Appearing May 3 before the health subcommittee, of which Senator James E. Murray is chairman, Surgeon General Scheele advised against statutory establishment of additional research institutes in special fields. Separate bills are now being considered by the committee to create such institutes for multiple sclerosis (S. 102), epilepsy (S. 659), arthritis and rheumatism (S. 705) and cerebral palsy (S. 1538). Rather, said Dr. Scheele, administrative arrangements for expanded research should be kept flexible and left to the discretion of the United States Public Health Service. Dr. Lennox, associate professor of neurology at Harvard and president of the International League Against Epilepsy, said that the greatest needs are more funds for grants-in-aid to increase research; expansion of diagnostic, treatment and training clinics; more and better special schools for persons with epilepsy and education of the public toward improvement of the sufferers' social and economic adjustment.

National Advisory Mental Health Council Meets

Meeting in Washington May 2-3, the National Advisory Mental Health Council approved a large number of applications for research and training grants. However, notification of the recipients was delayed because Congress has not completed action on the Public Health Service appropriations bill for the next fiscal year, beginning July 1, 1949. The size of the prospective grants is dependent on the funds allocated to the National Institute of Mental Health in 1949-1950. Two new members of the Council, beginning July 1, will be Dr. Franz Alexander, of Chicago, and Dr. S. Bernard Wortis, of New York City. They will take the places of Dr. William C. Menninger and Dr. John Romano, whose three year terms expire in June.

Medical Legislation

STATE LEGISLATION

California

Bill Introduced.—A. 2158 proposes to amend the penal code by adding a proviso making it a misdemeanor for any representative, agent or employee of a public pound to deliver or turn over to any medical school or person any dog or cat for experimental purposes and for any person to receive any dog or cat for experimental purposes from any public pound.

Colorado

Bill Enacted.—S. J. Mem. 4 was adopted March 28, 1949. It memorializes the Congress of the United States to support passage of the "Local Public Health Services Act of 1949."

Connecticut

Bill Introduced.—H. 1650 proposes to amend the act concerning commitment of narcotic addicts so as to include barbiturate addicts.

Florida

Bills Introduced.—H. 367 proposes to repeal a 1947 law providing that in cases of emergencies the superintendents of state institutions with the approval of the board of commissioners of state institutions may employ medical personnel from without the state and such personnel so long as employed exclusively at state institutions and so long as not engaged in private practice shall be exempt from the requirements as to prior residence in the state and from basic science examinations. H. 508, to amend the law relating to naturopathy, proposes that naturopathy shall be defined to mean the use and practice of psychologic, mechanical and material health sciences to aid in purifying, cleansing and normalizing human tissues for the preservation or restoration of health, according to the fundamental principles of anatomy, physiology and applied psychology, as may be required. Naturopathic practice shall employ and embrace the use of light, air, water, clay, heat, rest, diet, external applications, mechanical and electrical appliances, suggestotherapy, hydrotherapy, zone therapy, hygiene, first aid and sanitation; provided, however, that nothing in the act shall be held or construed to authorize any naturopathic physician to practice materia medica, surgery, chiropractic, or to treat any venereal, contagious or infectious diseases including cancer or to prescribe or administer hypnotic or narcotic drugs, nor shall the provisions of this act in any manner apply to or affect the practice of osteopathy, chiropractic, Christian Science or any other treatment authorized and provided for by law for the cure or prevention of disease. Persons licensed to practice naturopathy would be required to register their certificates annually. H. 515, H. 537, S. 307, S. 329, S. 332 and S. 347 propose laws looking to the establishment of a new school of medicine and dentistry in the state of Florida. These proposals would permit the school of medicine to acquire, use and dispose of cadavers for educational and scientific purposes. S. 267 proposes to make it unlawful for any person, firm or corporation filling prescriptions for the grinding, processing and fitting of eye glasses, lenses and frames to give or receive a rebate to any person, firm or corporation writing or giving prescriptions for such purposes.

Illinois

Bill Introduced.—S. 390 proposes, among other things, to establish a division of cancer control to promote necessary measures to reduce the mortality from cancer, heart disease and other chronic diseases.

Maine

Bill Introduced.—H. 2081, to amend the workmen's compensation act, proposes to permit injured employees to be treated by osteopaths and chiropractors.

Michigan

Bills Introduced.—H. C. Res. 39 proposes to memorialize the Congress of the United States to refrain from imposing on the citizens of this nation any form of compulsory insurance or any system of medical care designed for national bureaucratic control. H. 446 proposes that any program of instruction in sex hygiene in the public schools shall be administered by a person holding a teacher's certificate qualifying such person as supervisor in such field. H. 514, to amend the penal code, proposes to make it a felony for any person to wilfully administer to any pregnant woman any medicine, drug, substance or thing whatever or employ any instrument or other means whatever, with intent thereby to procure the miscarriage of any such woman unless the same shall be necessary to preserve the life of the woman and unless such action shall have been advised by two consulting physicians to be necessary for such purpose. S. 266 proposes to make it unlawful for any person to compound, dispense or sell drugs, medicines, pharmaceutical preparations, or other products which are imitations, substitutions for, or alternates of drugs, medicines, or preparations specified on a prescription of any individual licensed to write prescriptions or on the oral or written order of any such person. S. 267 proposes to amend the basic science act by exempting chiropractors therefrom. S. 292, to amend the medical practice act, proposes to exempt from licensure persons who are continuing medical education through hospital training, commonly referred to as internship or residency, and who meet all qualifications and conditions for the practice of medicine in the state, except the making of application to be registered and certified and the taking of examinations. Such person must be approved by the medical examining board for such training, must confine his training within a hospital or hospitals approved by the board, must receive no fees from any patient during the period

of training, and must not engage in such training for a period exceeding six years. S. 331 proposes an appropriation of \$2,500,000 for the construction and equipment of an outpatient medical clinic building in connection with the university hospital and medical school.

Minnesota

Bill Introduced.—S. 1411 proposes appropriations for nursing scholarships in the state.

Bill Enacted.—S. 14 has become Chapter 471 of the Laws of 1919. Among other things it requires a physician having a person under his treatment for tuberculosis to report full particulars regarding such person to the state board of health within seven days after the date on which the diagnosis is made.

Missouri

Bills Introduced.—H. 286 proposes the enactment of a hospital licensing law. S. 200 proposes that any person licensed by any licensing board in the state of Missouri to practice or use any science or system in treating diseases or defects of the human body who accepts, in addition to his fees or charges for professional services if any are received or made, any rebate, commission or any other type of payment, either directly or indirectly, in connection with the writing or filling of a prescription or formula or for any supplies the patient has been directed or advised to procure, shall be deemed to have engaged in unprofessional conduct, provided that any licensee otherwise authorized by law may prepare his own prescriptions or formulas or sell supplies for a reasonable charge.

New Hampshire

Bill Introduced.—S. J. Res. 7 proposes the creation of a committee for the purpose of studying and analyzing hospital care and rates to be paid by the state to hospitals for services to recipients of public assistance.

New York

Bills Enacted.—A. 578 has become Chapter 593 of the Laws of 1949. Among other things it provides for the making of a study to obtain factual evidence of the best practices and procedure desirable in carrying on a health program for the treatment and training of children who are physically handicapped because of cerebral palsy. A. 1871 has become Chapter 592 of the Laws of 1949. It provides that every physician shall give notice to the health officer of the county, city, town or village wherein such person resides of every case of cerebral palsy under his care and of all new cases of cerebral palsy of which he learns. S. 2196 has become chapter 680 of the Laws of 1949. It provides regulations for the licensing of unincorporated hospitals and lying-in asylums.

North Carolina

Bills Enacted.—S. 198 was ratified April 18, 1949. It authorizes and empowers the North Carolina Medical Care Commission to establish and promulgate rules and regulations fixing fair and reasonable standards whereby student physicians, dentists, pharmacists and nurses receiving scholarship loans under the section shall receive a credit on the principal and interest of such loan for each year or other period of time of practicing his or her profession in a rural area in the state. S. 297 was ratified April 20, 1949. It proposes that cancer clinics shall meet the minimum requirements of the American College of Surgeons for tumor clinics or the minimum requirements of the Division of Cancer Control of the North Carolina State Board of Health, and that each physician who shall staff such clinic must be certified by the American Board of the specialty of medicine of which he is engaged or be one who has been approved by his county medical society or its duly appointed representative and the Division of Cancer Control of the North Carolina State Board of Health.

Oklahoma

Bill Introduced.—H. 545 proposes the creation of a State Convalescent Hospital System for the purpose of providing an asylum for medical and convalescent care for aged, needy persons who are unable to provide for themselves without an asylum or hospital.

Oregon

Bills Enacted.—S. Res. 36 was adopted April 5. It provides for the creation of a special committee to investigate the various public institutions of the state with particular reference to the care, custody, training and activities of the inmates of state institutions. S. 239 was approved April 5, 1949. It provides for the promotion of medical science by the distribution and use of unclaimed human bodies for scientific purposes by the University of Oregon Medical School. S. 347 was approved April 4, 1949. It requires naturopaths to register their licenses annually and pay an annual registration fee of \$10.

Rhode Island

Bills Introduced.—H. 906 proposes regulations for the licensing of maternity hospitals. S. 35 proposes the appointment of a special commission to undertake a comprehensive objective study of the problems of alcoholism in the state.

Tennessee

Bill Enacted.—S. 332 has become Chapter 234 of the Public Acts of 1949. It provides regulations for the organization of nonprofit general welfare corporations with powers to provide both hospital service benefits and medical expense indemnity benefits.

Texas

Bills Introduced.—H. 880 proposes to abolish the state board of chiropractic examiners as being inactive and obsolete. S. 446 proposes regulations for the licensing of vocational nurses and defines a vocational nurse as a person who attends or cares for the sick for compensation or hire, directly or indirectly, other than a registered nurse.

Coming Medical Meetings

American Medical Association, Atlantic City, June 6-10. Dr. George F. Lull, 535 N. Dearborn St., Chicago 10, Secretary.

American Academy of Neurology, French Lick, Indiana, French Lick Springs Hotel, June 1-3. Dr. Joe R. Brown, 19 Millard Hall, University of Minnesota, Minneapolis 14, Secretary.

American Academy of Tuberculosis Physicians, Atlantic City, Hotel Dennis, June 4. Dr. Oscar S. Levin, P. O. Box 7011, Denver 6, Colo., Secretary.

American Association of Railway Surgeons, Chicago, Drake Hotel, June 30-July 2. Dr. Chester C. Guy, 5800 Stoney Island Ave., Chicago 37, Secretary.

American Association of the History of Medicine, Lexington, Ky., Lafayette Hotel, May 23-24. Dr. Benjamin Spector, 416 Huntington Ave., Boston 15, Secretary.

American College of Chest Physicians, Atlantic City, Ambassador Hotel, June 2-5. Mr. Murray Kornfield, 500 N. Dearborn St., Chicago 10, Executive Secretary.

American College of Radiology, Atlantic City, Chalfonte-Haddon Hall, June 5. Mr. William C. Stronach, 20 N. Wacker Drive, Chicago 6, Secretary.

American Dermatological Association, Hot Springs, Va., May 25-28. Dr. Louis A. Brunsting, 102 Second Ave. S.W., Rochester, Minn., Secretary.

American Gastro-Enterological Association, Atlantic City, Claridge Hotel, June 3-4. Dr. Dwight L. Wilbur, 655 Sutter Street, San Francisco 2, Secretary.

American Gastroscopic Society, Atlantic City, Claridge Hotel, June 3-4. Dr. J. Edward Berk, 255 S. 17th St., Philadelphia 3, Secretary.

American Goiter Association, Madison, Wis., Hotel Loraine, May 26-28. Dr. Thomas C. Davison, 478 Peachtree St., N.E., Atlanta 3, Ga., Secretary.

American Laryngological Association, New York, May 16-17. Dr. Louis H. Clerf, 1530 Locust St., Philadelphia, Secretary.

American Medical Women's Association, Atlantic City, June 4-5. Dr. Augusta Webster, 104 S. Michigan Ave., Chicago, Secretary.

American Neurological Association, Atlantic City, June 13-15. Dr. H. Houston Merritt, 710 W. 168th St., New York 32, Secretary.

American Ophthalmological Society, Hot Springs, Va., The Homestead, June 2-4. Dr. Maynard C. Wheeler, 30 W. 59th St., New York, Secretary.

American Orthopedic Association, Colorado Springs, May 18-21. Dr. C. Leslie Mitchell, Henry Ford Hospital, Detroit 2, Secretary.

American Otological Society, New York, May 18-19. Dr. Gordon D. Hoople, 713 E. Genesee St., Syracuse, N. Y., Secretary.

American Proctologic Society, Columbus, Ohio, May 31-June 4. Dr. W. Wendell Green, 1838 Parkwood Ave., Toledo 2, Ohio, Secretary.

American Psychiatric Association, Montreal, Canada, May 23-27. Dr. Leo H. Bartemeier, General Motors Bldg., Detroit 2, Secretary.

American Radium Society, Atlantic City, June 5. Dr. Hugh F. Hare, 605 Commonwealth Ave., Boston 15, Secretary.

American Therapeutic Society, Atlantic City, June 2-5. Dr. Oscar B. Hunter, 915 Nineteenth St. N.W., Washington, D. C., Secretary.

American Urological Association, Los Angeles, Hotel Biltmore, May 16-19. Dr. Thomas D. Moore, 899 Madison Ave., Memphis 3, Tenn., Secretary.

Association for the Study of Internal Secretions, Atlantic City, June 3-4. Dr. Henry H. Turner, 1200 N. Walker St., Oklahoma City 3, Secretary.

Idaho State Medical Association, Sun Valley, June 20-23. Dr. Alfred M. Popma, 220 N. First St., Boise, Secretary.

Illinois State Medical Society, Chicago, Palmer House, May 16-18. Dr. Harold M. Camp, 224 S. Main St., Monmouth, Secretary.

International Congress on Rheumatic Diseases, New York, Hotel Waldorf-Astoria, May 30-June 3. Dr. Philip S. Hench, Mayo Clinic, Rochester, Minn., Chairman, American Committee.

Maine Medical Association, Poland Spring, Poland Spring House, June 19-21. Dr. Frederick R. Carter, 142 High St., Portland 3, Secretary.

Massachusetts Medical Society, Worcester, May 24-27. Dr. H. Quimby Gallupe, 8 Fenway, Boston 15, Secretary.

New Hampshire Medical Society, Newcastle, Hotel Wentworth, June 14-15. Dr. Carleton R. Metcalf, 5 S. State St., Concord, Secretary.

North Dakota State Medical Association, Minot, May 14-17. Dr. O. A. Sedlak, 702 First Ave. S., Fargo, Secretary.

Oklahoma State Medical Association, Tulsa, Mayo Hotel, May 15-19. Mr. R. H. Graham, 210 Plaza Court Bldg., Oklahoma City, Secretary.

Society for Investigative Dermatology, Atlantic City, Ritz Carlton Hotel, June 11-12. Dr. S. William Becker, 55 E. Washington St., Chicago 2, Secretary.

Society of American Bacteriologists, Cincinnati, May 15-20. Dr. John Blair, Hospital For Joint Diseases, New York, Secretary.

Society of Biological Psychiatry, Atlantic City, Chalfonte-Haddon Hall, June 12. Dr. George N. Thompson, 1136 W. Sixth St., Los Angeles, Secretary.

South Carolina Medical Association, Myrtle Beach, May 17-19. Dr. Julian P. Price, 15 W. Cheves St., Florence, Secretary.

South Dakota State Medical Association, Yankton, May 22-24. Dr. Roland G. Mayer, 22½ S. Main St., Aberdeen, Secretary.

Southeastern Surgical Congress, Biloxi, Miss., May 23-26. Dr. Benjamin T. Beasley, 45 Edgewood Ave. S.E., Atlanta 3, Ga., Secretary.

Western Branch of American Public Health Association, Los Angeles, Hotel Biltmore, May 30-June 1. Mr. Walter S. Mangold, University of California, Berkeley, Calif., Secretary.

GOVERNMENT SERVICES

ARMY

MEDICAL OFFICERS NEEDED IN MARYLAND

The Board of Civil Service Examiners, Chemical Corps, Camp Detrick, Frederick, Md., announces that a civil service examination for position of medical officer at Camp Detrick is now open to fill positions for which the salary ranges from \$6,235 to \$10,305 a year. No written test is required. Applicants will be rated on the basis of their training and experience as described in their applications. Information and application blanks may be obtained from the above address.

SYMPOSIUM FOR RESERVE OFFICERS AT AUGUSTA

A symposium for Medical Department reserve officers of the Third Army Area was held at Oliver General Hospital, Augusta, Ga., April 21-24. Dr. G. Lombard Kelly, Dean, University of Georgia School of Medicine, spoke on "Mutual Cooperation Between Medical Schools and Army Hospitals in Undergraduate and Postgraduate Medical Education." Officers of the Surgeon General's Office who participated in the program were Brig. General George E. Armstrong, the Deputy Surgeon General; Col. Paul I. Robinson, Chief, Personnel Division, and Col. Charles K. Holmes, Chief, Civilian Components Division. Col.

James P. Cooney, Chief, Radiological Branch, Division of Military Application, U. S. Atomic Energy Commission, and Radiological Consultant for the Office of the Surgeon General, spoke on "Medical Aspects of Atomic Energy."

HISTORY OF WORLD WARS I AND II

The long-awaited official history of the Army's effort in World War I has been completed in seventeen volumes and is in the process of printing. The first two volumes are expected to be ready for release within thirty days. The official history of World War I was not begun until after the war was over, whereas historical planning for World War II was made during that war and historians were present at the front during all combat operations. Three volumes of the history of World War II have already been released, and two other volumes are now at the printers. The official history of World War I contains many charts, maps, photographs and tables never before published. It tells the authentic story in the form of carefully selected letters, reports and other documents. A 70 page narrative summary in volume I provides an account of the principal operations on the western front following entry of the United States into the war. The basic records from which this history was written are in the National Archives in Washington, D. C.

PUBLIC HEALTH SERVICE

EXAMINATION FOR PUBLIC HEALTH NURSE

The U. S. Civil Service Commission has extended the closing date for the receipt of applications for its Public Health Nurse examination to June 30. The positions to be filled are in Washington, D. C., and vicinity; a few positions in territories and possessions of the United States may also be filled. Salaries range from \$3,727 to \$4,479 a year.

No written test is required. To qualify, competitors must have completed a three year nursing course or a two year nursing course plus appropriate nursing experience or education. Included in or supplementary to this education, applicants must show a minimum of 30 semester hours in an approved program of study in public health nursing. In addition, they must have had a minimum of one year's experience in public health nursing in a generalized community public health program. For positions paying \$4,479, additional experience in staff nursing or supervisory experience is required. Applicants must be registered as professional nurses at the time of appointment.

Interested persons may obtain application forms from first and second class post offices, from Civil Service regional offices, or from the U. S. Civil Service Commission, Washington 25, D. C. Applications should be filed with the Commission's Washington office.

DIABETES TESTS AT THE CAVALCADE OF PROGRESS

The Monmouth County Medical Society, the New Jersey State Department of Health and the U. S. Public Health Service cooperated in presenting to the public for the first time the new diabetes blood sugar screening test, April 4-10, during the Cavalcade of Progress at Asbury Park, N. J. Twenty-five thousand persons visited the exhibits, and of those 1,300 were selected for the diabetes screening test. Only those who had eaten from thirty to ninety minutes before applying for the test were selected. The public was notably interested in the simplicity of the test and the rapid process of arriving at results. Those whose blood sugar was reported normal were so advised

and went on their way. Those whose blood sugar were reported above normal were so advised by the physician in charge, and a venous sample was taken for additional analysis by the Somogyi-Nelson method of determination of blood sugar. The two tests resulted in the discovery of 49 previously unknown cases of diabetes.

Q FEVER ORGANISM VERY RESISTANT TO HEAT

The Public Health Service reports that the pasteurization of milk does not always kill the organism that causes Q fever that may be present. Studies made in the Los Angeles area in cooperation with the California State Department of Health indicate that pasteurization usually destroys the Q fever organisms in naturally infected milk, but that a few of them occasionally remain alive and apparently capable of producing the disease after pasteurization. In tests made with each of the two methods of pasteurization employed in California, the pasteurized milk from one of the vat tests still contained living Q fever organisms. Three of thirty-two specimens taken from bottles of vat-pasteurized market milk and one of four specimens of vat-pasteurized market cream were shown to contain living Q fever organisms. The studies were reported by Dr. Robert J. Huebner in the April 22 issue of *Public Health Reports*. Earlier studies had shown nearly two thirds of the dairies tested in that area produced raw milk containing the Q fever organisms (*Coxiella burnetii*).

SYMPOSIUM ON INDUSTRIAL WASTE

A symposium on water, sewage and industrial waste will be held June 23-24 at the Department of Commerce Auditorium, Washington, D. C. The study section sponsoring this symposium is one of twenty-three groups of special consultants organized to aid the National Institutes of Health in promoting research. Inquiries concerning this symposium should be addressed to V. M. Ehlers, Texas State Department of Health, Austin, Texas, Chairman of the Sanitation Study Section.

Medical News

(Physicians will confer a favor by sending for this department items of news of general interest: such as relate to society activities, new hospitals, education and public health. Programs should be received at least two weeks before the date of meeting.)

ALABAMA

State Medical Election.—At the recent annual session of the Medical Association of the State of Alabama, Dr. Frank C. Wilson, Birmingham, was elected president. The association does not have a president elect. Dr. William R. Carter, Repton, was chosen vice president of the Southwestern Division of the association. Dr. Douglas L. Cannon, Montgomery, continues as secretary.

ARIZONA

Personal.—Dr. C. A. Thomas, Tucson, was awarded a medal and scroll by the Pan American Congress of Tuberculosis, meeting in Mexico, D. F., recently, for his work in chest surgery and his aid in the control of tuberculosis.

Psychiatry and Neurology Meeting.—The May meeting of the Arizona Society of Psychiatry and Neurology will be held in Phoenix May 21 in the auditorium of the Good Samaritan Nursing Home. In addition to election of officers for the coming year, Dr. John R. Green, Phoenix, and Dr. Frederick A. Gibbs, Chicago, will speak on "Electroencephalography."

COLORADO

Rocky Mountain Cancer Conference.—The third annual Rocky Mountain Cancer Conference will be held at the Shirley Savoy Hotel, Denver, July 14-15, under the sponsorship of the Colorado State Medical Society, Rocky Mountain Cancer Foundation, and the Colorado Division of the American Cancer Society. A half day will be devoted to a symposium on the leukemias. The guest speakers include Drs. George F. Cahill, New York; Sherwood Moore, St. Louis; Cecil S. O'Brien, Iowa City; Fred W. Stewart, New York; John DeJ. Pemberton, Rochester, Minn.; Frederick D. Weidman, Philadelphia; Cyrus C. Sturgis, Ann Arbor, Mich., and Idys Mims Gage, New Orleans. There is no registration fee. The conference is financed by contributed funds through the American Cancer Society.

CONNECTICUT

Personal. Dr. James C. Hart has been appointed director of the Bureau of Preventable Diseases of the Connecticut State Department of Health to succeed the late Dr. Eugene E. Lamoureux. Dr. Hart has been acting director of the bureau for the past four months. He is a graduate of Yale University School of Medicine, New Haven, and practiced medicine in New Haven from 1934 to 1940.

Dr. Talbot Appointed to Institute of Living.—In connection with a greatly expanded program for care of the sick, teaching and research, Dr. William B. Talbot, New York, has been appointed assistant to the president of the Institute of Living in Hartford. Dr. Talbot, a graduate of Tulane University of Louisiana School of Medicine, New Orleans, for the past fourteen years has been administrator of the New York Post-Graduate Medical School and Hospital in New York City. He served at the U. S. Veterans Hospital in Bronx, New York; for seven and one-half years as assistant director of Grasslands Hospital in Valhalla, N. Y., and clinical psychiatrist and director of psychiatric service to county institutions.

FLORIDA

Laboratory to Examine Vitamin Pills.—The State of Florida has established a \$30,000 vitamin laboratory in the Mayo Building in Tampa to test the vitamin content of foods, pills and livestock feeds. Vincent E. Stewart, Ph.D., and Mr. Harold Hoffman will have charge of the investigations. Bread was selected as one of the first items to be tested.

Honor Two Board of Health Members.—Two members of the Florida State Board of Health staff have been honored for outstanding work in their fields. Dr. Roger F. Sondag, Jacksonville, director, Bureau of Preventable Diseases, was awarded a bronze medal by the American Cancer Society "for distinguished service in cancer control." The awards committee of the Florida Engineering Society selected David B. Lee, M.S., Jacksonville, chief sanitary engineer, for exceptional service to the engineering profession of Florida.

GEORGIA

Centennial Meeting of State Medical Association.—The Medical Association of Georgia observed the centennial of its founding at the annual meeting in Savannah, May 10-13. Guest speakers included:

William L. Benedict, Rochester, Minn., The Abner Wellborn Calhoun Lecture: Clinical Significance of Closure of the Retinal Blood Vessels.
Conrad G. Collins, New Orleans, Diseases of the Cervix.
Ralph S. McLaughlin, Charleston, W. Va., What the Medical Profession I
Catherine " " Detection of Early Cancer by
Means o
Ralph M. " "nesthesiology: New Wine and Old
Bottles.

The presidential address was delivered Thursday noon at a public session by Dr. Edgar Hill Greene, Atlanta, on "Our Problems at the Beginning of the Association's Second Hundred Years." Scientific and technical exhibits were on display.

ILLINOIS

Lectures for County Societies.—The Illinois State Medical Society has arranged the following lectures for county societies:

May 31, Iroquois County Medical Society in Watseka, James H. Hutton, Chicago, Hormone Preparations and Their Uses.
June 7, Bureau County Medical Society in Spring Valley, John R. Vonachen, Peoria, Modern Trends in Pediatrics.
June 9 Will-Grundy County Medical Society in Joliet, George H. Rezek, Cicero, Female Endocrines.
June 16, Effingham County Medical Society in Effingham, Archibald L. Hoynes, Chicago, The Known and Unknown in Poliomyelitis.
June 23, Will-Grundy County Medical Society in Joliet, James J. Callahan, Chicago, General Fractures.

Advantages of Small Town Practice.—The Illinois State Medical Society entertained seventy-five young interns and residents at the Hotel LaSalle, Chicago, on April 26 when three veteran small town doctors pointed out the advantages of rural practice. They explained how to set up an office and how to handle patients and other problems. Another doctor, who recently located in a small town down state, told how he solved problems with the help of neighbors. A small town banker discussed finances. The young physicians were given a list of forty rural Illinois communities in need of additional physicians. Another list contained the names of thirty country doctors who plan to retire and are looking for young physicians to replace them.

Chicago

Drs. Hektoen and Wilder Receive Ricketts Award.—The University of Chicago will honor two of its alumni May 23 when it presents the first Howard Taylor Ricketts Awards for outstanding medical work to Drs. Ludvig Hektoen, Chicago, and Russell Wilder, Rochester, Minn. The award, established by Mrs. H. T. Ricketts in recognition of outstanding medical work, will be presented annually on May 3, anniversary of the death of Dr. Howard Taylor Ricketts, who fell victim to typhus while working in this field in Mexico, D. F., in 1910. Dr. Hektoen, chairman of the department of pathology at the university from 1901 to 1935, encouraged Dr. Ricketts in his research on typhus. Dr. Wilder, chairman of the university's department of medicine from 1929 to 1931, professor of medicine at the Mayo clinic since 1931, and now head of the department, worked with Dr. Ricketts in Mexico. After Dr. Ricketts' death Dr. Wilder remained in Mexico to complete the work. At the presentation ceremony at the University of Chicago Clinics Dr. Wilder will speak on "Rickettsial Diseases: Discovery and Conquest."

KANSAS

State Medical Meeting.—At the annual meeting of the Kansas Medical Society in Topeka May 9-12, the guest speakers were:

Thomas T. Mackie, Winston-Salem, N. C., Tropical Disease Problems Among Veterans of World War II.
Henry K. Ransom, Ann Arbor, Mich., Inflammatory Lesions of the Intestines.
Lee E. Sutton Jr., Richmond, Va., Early Diagnosis of Poliomyelitis.
Walter A. Fansler, Minneapolis, Symptoms and Early Diagnosis of Carcinoma of the Large Bowel.
Karl H. Pfuetze, Cannon Falls, Minn., Modern Approach to Control of Tuberculosis.
Robert J. Crossen, St. Louis, Medical Gynecology.
Joseph H. Pratt Jr., Rochester, Minn., Intestinal Obstruction.
William A. Sodeman, New Orleans, Pitfalls in Antibiotic Therapy.
Paul A. O'Leary, Rochester, Minn., Dermatitis of the Hands.
William D. Gill, San Antonio, Texas, and C. Wilbur Rucker, Rochester, Minn., guest speakers at the Eye, Ear, Nose and Throat Luncheons.

Thursday afternoon's program included a Symposium on Medical Legislation, with Dr. Oscar W. Davidson, Kansas City, presiding. Round table luncheons were held each day. The speaker at the annual banquet Wednesday was Mr. Arch N.

Women's Clubs Oppose Compulsory Health Insurance.—Delegates to the annual convention of the General Federation of Women's Clubs, which has a membership of 5,000,000 in the United States, adopted unanimously April 28 a resolution which opposed "government control of health services" and supported "the extension and development of Voluntary Health Insurance." The resolution states that the federation "goes on record against Government control of health services which would jeopardize free enterprise, establish heavy new tax burdens and unprecedented National deficits, and infringe upon the powers of the individual states."

Annual Meeting of Laryngological Association.—The American Laryngological Association will hold its annual meeting at the Biltmore, New York, May 16-17, under the presidency of Dr. Frederick T. Hill, Waterville, Maine. Those speaking by invitation include:

Abraham White, Ph.D., New Haven, Conn., Factors Influencing the Growth of Lymphoid Tissue.
Joseph C. Doane, Philadelphia, An Internist Looks at Specialism.
Norman L. Hoerr, and Julius W. McCall, Cleveland, Changes in the Nasal Mucosa Following Laryngectomy.
Joseph C. Aub, Boston, Advances in Our Knowledge of Cancer.

The President's Reception followed by the banquet will be held Monday evening at 6 p.m.

Dr. Doull Appointed to Leonard Wood Memorial.—Dr. James A. Doull, Washington, D. C., medical director, United States Public Health Service, has been made medical director of the Leonard Wood Memorial (American Leprosy Foundation), succeeding Dr. H. Windsor Wade, Culion, Philippine Islands, who because of ill health has been relieved of administrative duties and appointed associate medical director. Dr. Wade will continue his pathologic studies at Culion, and the editorship of the *International Journal of Leprosy*. The headquarters of the medical department of the memorial has been transferred from Culion, P. I., to 1832 M. Street, N. W., Washington 6, D. C. Cable address: Woodmem, Washington.

American Dermatological Association.—The annual meeting of the American Dermatological Association, Inc., will be held May 25-28 at the Homestead, Hot Springs, Va. The presidential address will be delivered by Dr. Harry R. Foerster, Milwaukee. Among the subjects to be presented will be Relation of Sunlight, Complexion and Heredity to Carcinogenesis of the Skin, Hormones in Acne: A Clinical Evaluation of Their Use in Adolescent Women; Effects of Podophyllin on Basal-Cell Epithelioma and on Seborrhoeic, Senile, X-Ray, and Radiation Keratoses; Treatment of Syphilis with Aureomycin Given Orally, and Hiroshima: Three Years After. A symposium on Undergraduate Teaching in Dermatology, with Dr. Francis E. Sencar, Chicago, as moderator will be presented Wednesday afternoon.

Psychiatric Association Meeting in Montreal.—The American Psychiatric Association will hold its annual meeting at the Windsor and Mount Royal hotels in Montreal, Canada, May 23-27. The program includes, among others, the following invited speakers:

Wilder G. Penfield, Montreal, Canada, Psychical Seizures and Psychoparetic Automatism.
Herbert H. Jasper, Westmount, Quebec, Electroencephalogram in Epileptic Automatism and Equivalent States.
Francis L. McNaughton, Montreal, Medical Therapy in Relation to the Classification of the Epilepsies.
C. Bos and H. Lehmann, Montreal, Studies on Psychiatric Patients Undergoing Nitrous Oxide Treatments.
John A. Belisle, Eloise, Mich., Necessity of the "Calculated Risk" in Parole Policy.
William T. Dixon, New York, Sludged Blood Studies in Alcoholics and Other Psychiatric In-Patients.
William W., a Co-Founder, The Society of Alcoholic Anonymous.
Lela S. Anderson, R.N., New York, Human Factors Involved in Providing Better Nursing Treatment and Care of Patients in Mental Hospitals.
Mr. Howard Hanson, Rochester, N. Y., Effective Power of Consonance and Dissonance in Music.
Fritz Redl, Ph.D., Detroit, Dynamics of Group Therapy.
Howard A. Rusk, New York, America's No. 1 Problem—Chronic Disease and an Aging Population.
Kenneth G. Gray, Toronto, Canada, Psychiatric Evidence in Criminal Cases.
Hudson Hoagland, Ph.D., and Gregory Pincus, Sc.D., Worcester, Mass., Adrenal Cortical Responses to Stress in Normal Men and in Those with Personality Disturbances.
Robert A. Cleghorn and B. F. Graham, Ph.D., Montreal, Studies of Adrenal Cortical Activity in Psychoneurotic Subjects.
Meta A. Neuman, M.F., W. B. D. C., Pick's Disease.
Winifred Ashby, Ph.D., W. B. D. C., An Approach to the Solution of Mental Illnesses: Brain Enzyme Studies.
Charles Kligerman, Cleveland, Ohio, Observations in Neurodermatitis.

Several symposiums have been scheduled: Monday, Role of Psychoanalysis in Various Aspects of Medical Education and Symposium for Hospital Administrators; Tuesday, Symposium on Alcohol; Wednesday, United States Public Health; Friday, State Public Health, Veterans Administration Symposium and Medical Testimony in Court. Round table dinner meetings

will be held. Prof. David Thomson, Ph.D., McGill University, Montreal, will give the dinner address Wednesday evening on "Caries in the 'Ivory Tower.'" Motion pictures will be shown daily.

LATIN AMERICA

Guatemala Hospital Program.—Guatemala has begun a national hospital building program designed to create an integrated system of sixty-seven hospitals to provide a minimum level of adequate hospital facilities. The Guatemala Institute of Social Security, an autonomous body, will implement and control the program expected to be realized in fifteen to twenty years at a cost of \$25,000,000 to \$30,000,000. The system will revolve around a central hospital with 1,000 beds in Guatemala City, and will involve five other regional hospitals with 200 to 300 beds, seventeen departmental hospitals with 75 to 200 beds and forty-four rural hospitals with 30 to 50 beds. The central hospital, to be known as Roosevelt Hospital, is nearly completed. It was constructed at a cost of \$4,000,000, of which 45 per cent was a grant from the Institute of Inter-American Affairs.

Mexican Congress of Obstetrics and Gynecology.—The first Congress of Obstetrics and Gynecology of Mexico will be held in the Justo Sierra Auditorium and the Hotel de Prado, México, D. F., May 22-28. The scientific sessions will be divided into five groups: surgical gynecology; medical gynecology and endocrinology; infertility and sterility; obstetrics; and laboratory investigations, radiology and physiology. The program includes invited speakers from Argentina, Brazil, Cuba, Colombia, Chile, France, Panama, Peru, Uruguay, Venezuela, Spain and the United States and Mexico. Guests from the United States include Drs. Richard W. TeLinde, Baltimore; Arthur T. Hertig, Boston; M. Edward Davis, Chicago; B. Bernard Weinstein, New Orleans, and Edwin C. Hamblen, Durham, N. C. The congress is open for registration to interested physicians throughout the world. The secretaries are Dr. Carlos D. Guerrero and Dr. Alphonso Bravo, Marsella 11, México, D. F., of whom inquiries can be made.

CORRECTIONS

Lithium and Cesium.—In the editorial note in *THE JOURNAL*, March 12, page 692, the statement that lithium is the most reactive metal known is erroneous. Cesium, a member of the same family of metals as lithium, is considered to be the most reactive.

Proctologic Society Meeting.—Dr. Harry E. Bacon, Philadelphia, is president of the American Proctologic Society holding its annual meeting in Columbus, Ohio, May 31-June 4, and not Dr. Albert G. Shutte, Milwaukee, as stated in *THE JOURNAL*, April 30, page 1288. Dr. Shutte is vice president.

The Use of Streptomycin in Surgical Patients.—The illustrations appearing in the article by this title in *THE JOURNAL*, April 2, page 902, were partially incorrect. Figure 5, on page 904, is actually figure 4 and was made before streptomycin therapy was started. Figure 4 is actually figure 5 and shows the results after streptomycin therapy. Figure 6 is correctly labeled, but the photographer reversed the negative, so that the right side of the chest, which in figures 4 and 5 is to the reader's left, in figure 6 is incorrectly shown on the reader's right.

Marriages

THOMAS BUEGER WRIGHT, Cincinnati, to Miss Florie Elizabeth Kelly of Jacksonville, Fla., March 27.

WILLIAM A. VIELE JR., Seattle, to Miss Sarah Catherine Hargrove at Houston, Texas, March 19.

JOHN DEAYER ALEXANDER, New York, to Miss Helen King Kleberg in Kingsville, Texas, April 16.

WILLIAM J. BROWN JR., Cedar Rapids, Iowa, to Miss Jean Rowe of Galesburg, Ill., March 13.

HUGH STEVENS COLQUITT to Miss Beulah Nelson Dowda, both of Smyrna, Ga., March 9.

NORMAN DEANE, Newark, N. J., to Miss Elaine Rudnick of New York, March 10.

M. EUGENE FLIPSE JR., to Miss Carolyn Law, both of Miami, Fla., in March.

HARRY MANDELBAUM, Brooklyn, to Miss Rose Lader of New York, April 3.

R. A. ABRAHAM, Brooklyn, to Miss Laurette Weiss of New York, February 20.

Deaths

Harold Laurens Dundas Kirkham, Houston, Texas; born in Norfolk, England, March 24, 1887; University of Texas School of Medicine, Galveston, 1909; specialist certified by the American Board of Surgery and the American Board of Plastic Surgery; past president, vice president and trustee of the American Association of Oral and Plastic Surgeons; fellow of the Southern Surgical Association and the Texas Surgical Society, of which he had been president; member of the American Association for the Surgery of Trauma, the American Society of Plastic and Reconstructive Surgery and the American Medical Association; fellow of the American College of Surgeons; served in the Navy during World War I; recalled to active duty in December 1941 and appointed to the rank of captain in 1942; head of the department of plastic surgery for the U. S. Naval Hospital in San Diego from July 20, 1943, to March 3, 1945; in April 1946 awarded the Legion of Merit; received a commendation from the Surgeon General of the Navy for outstanding devotion to duty following the Texas City Disaster on April 16, 1947; at the time of his retirement on Oct. 1, 1947 was chief of plastic surgery at the U. S. Naval Hospital; affiliated with St. Joseph's Infirmary, Memorial Hospital, Jeff Davis Hospital and the Southern Pacific Hospital; died March 18, aged 62, of coronary thrombosis.

Victor Francis Cullen ☉ Baltimore; born in Williamsport, Md., Sept. 5, 1881; Johns Hopkins University School of Medicine, Baltimore, 1906; specialist certified by the American Board of Internal Medicine; member of the American College of Chest Physicians and the American Trudeau Society, of which he had been director and vice president; past president of the Southern Tuberculosis Conference and the National Tuberculosis Association; formerly vice president of the Medical and Chirurgical Faculty of Maryland; past president of the Maryland Tuberculosis Association; in 1947 retired as superintendent of the Maryland State Tuberculosis Sanatorium and of all Maryland tuberculosis sanatoriums; in 1924 had been awarded the Knighthood of St. Gregory by Pope Pius XI, in recognition of work in tuberculosis in Maryland; died in the Union Memorial Hospital March 9, aged 67, of hypertensive cardiovascular disease.

Arthur Nathaniel Alling, New Haven, Conn.; born in New Haven, July 1, 1862; College of Physicians and Surgeons, medical department of Columbia College, New York, 1891; member of the American Medical Association and the American Ophthalmological Society; fellow of the American College of Surgeons; joined the Yale University School of Medicine in 1893 as lecturer in ophthalmology; in 1894 became an instructor, in 1902 clinical professor and in 1938 professor emeritus; for many years affiliated with the New Haven Dispensary; on the staffs of the New Haven and Meriden hospitals; died March 15, aged 86, of coronary occlusion.

Samuel Kennedy ☉ Shelbyville, Ind.; born in Shelbyville, Ind., March 16, 1867; Medical College of Indiana, Indianapolis, 1891; an Associate Fellow of the American Medical Association; also a graduate in pharmacy; past president of the Shelby County Medical Society; formerly vice president of the Indiana State Medical Association and for many years a counselor of the Sixth District; in 1900, 1910, 1930 and 1940 a delegate to the U. S. Pharmacopoeial Convention in Washington, D. C.; for many years surgeon for the New York Central Railroad and the Pennsylvania Railroad; died February 1, aged 81, of cerebral hemorrhage.

Thomas Joseph Donovan ☉ Houston, Texas; born in Eden Valley, Minn., July 19, 1909; Harvard Medical School, Boston, 1934; assistant professor of clinical pediatrics at the Baylor University College of Medicine; specialist certified by the American Board of Pediatrics; certified by the National Board of Medical Examiners; member of the American Academy of Pediatrics; served during World War II; on the staffs of the Hermann, Jefferson Davis and Memorial hospitals and St. Joseph's Infirmary, where he died March 4, aged 39, of cancer of the liver.

Henry Tate Allingham, Omaha; John A. Creighton Medical College, Omaha, 1912; member of the American Medical Association; affiliated with Creighton Memorial St. Joseph's Hospital, Doctors Hospital and St. Catherine's Hospital; died March 13, aged 69.

John T. Anderson ☉ Warrensburg, Mo.; Missouri Medical College, St. Louis, 1889; died February 22, aged 79, of pneumonia.

Jeannie Oliver Arnold, Laguna Beach, Calif.; Boston University School of Medicine, 1891; formerly physician for Pembroke College in Providence, R. I.; died in St. Joseph Hospital, Orange, February 20, aged 88, as the result of a fall.

William Abraham Bostick, Milledgeville, Ga.; University of Georgia Medical Department, Augusta, 1924; member of the American Medical Association; past president of the Baldwin County Medical Society; on the staff of Milledgeville State Hospital; died February 2, aged 68, of cerebral hemorrhage.

Arthur George Davis ☉ Erie, Pa.; University of Buffalo School of Medicine, 1913; specialist certified by the American Board of Orthopaedic Surgery; member and formerly vice president of the American Academy of Orthopaedic Surgeons; member of the American Orthopaedic Association; fellow of the American College of Surgeons; on the staffs of the Hamot and St. Vincent's hospitals and Zem Zem Hospital for Crippled Children; died February 20, aged 61, of coronary disease.

Earl John Dorwaldt ☉ Albany, N. Y.; Albany (N. Y.) Medical College, 1924; associate professor of hygiene at the New York State College for Teachers; died in St. Peter's Hospital February 7, aged 51, of rheumatic heart disease.

Holly T. Drake, Marion, Ill.; Kentucky School of Medicine, Louisville, 1898; died in Holden Hospital, Carbondale, February 11, aged 82, of cerebral thrombosis and diabetes mellitus.

William Preston Drake, Bowling Green, Ky.; Kentucky University Medical Department, Louisville, 1905; member of the American Medical Association; for many years oculist for the Louisville and Nashville Railroad; died in Atlanta, Ga., February 10, aged 66, of coronary thrombosis.

Arthur Garfield Dula, Lenoir, N. C.; Leonard Medical School, Medical Department of Shaw University, Raleigh, 1912; died February 14, aged 65, of a heart attack.

Oswald Alfonso Eaddy ☉ Keithville, La.; Atlanta Medical College, 1914; died in Phoenix, Ariz., February 27, aged 57, of cerebral hemorrhage and heart disease.

Kiefer Killen Eason, Tulsa, Okla.; Baylor University College of Medicine, Dallas, Texas, 1926; served during World War I; affiliated with Hillcrest Memorial Hospital, where he died February 22, aged 50, of subacute yellow atrophy of the liver and virus hepatitis.

Crum Epler ☉ Pueblo, Colo.; University of Tennessee Medical Department, Nashville, 1894; member of the House of Delegates of the American Medical Association in 1908, 1932, 1933 and 1934; past president of the Colorado State Medical Society; served during the Spanish-American War; fellow of the American College of Surgeons; served on the staff of St. Mary Hospital; died February 6, aged 77, of cerebral hemorrhage.

Jack Wallace Ferguson, Ceredo, W. Va.; Ohio State University College of Medicine, Columbus, 1921; member of the American Medical Association; died February 5, aged 52, of acute dilatation of the heart.

Ignatius L. J. Fitzpatrick, Philadelphia; Medico-Chirurgical College of Philadelphia, 1901; formerly on the board of health; served on the staff of Philadelphia General Hospital; died February 16, aged 70, of carcinoma of the urinary bladder.

Harry Pugh Forsyth ☉ Alexandria, La.; Tulane University of Louisiana School of Medicine, New Orleans, 1929; past president of the Rapides Parish Medical Society; consultant for the state board of health; on the staff of the Huey E. Long Charity Hospital in Pineville and Baptist Hospital, where he died March 12, aged 51, of coronary occlusion and a fracture of the first lumbar vertebra received in an automobile accident in October 1948.

Benno Hugh Fultz ☉ San Antonio, Texas; College of Physicians and Surgeons, Baltimore, 1901; on the staff of Santa Rosa Hospital; died February 15, aged 74, of arteriosclerosis.

Cecil Hughes Gilliam, Galveston, Texas; University of Texas School of Medicine, Galveston, 1939; member of the American Medical Association; served during World War II; died February 16, aged 38, of coronary occlusion.

Edmund Francis Hanlon ☉ Hazleton, Pa.; Jefferson Medical College of Philadelphia, 1927; served during World War II; died February 16, aged 45, of coronary occlusion.

Oliver L. Iden ☉ Chillicothe, Ohio; Eclectic Medical Institute, Cincinnati, 1899; past president of the Ross County Medical Society; on the staff of Chillicothe Hospital; died February 6, aged 74, of heart disease.

Joseph Kahn * Milwaukee; University of Pennsylvania Department of Medicine, Philadelphia, 1888; member of the staff of Mount Sinai Hospital; died February 20, aged 82, of coronary occlusion.

Orson Arza Kellogg, Beloit, Wis.; Rush Medical College, Chicago, 1899; died in the Veterans Administration Hospital, Tomah, February 28, aged 76, of coronary heart disease and bronchopneumonia.

Rufus S. Kight * Norfolk, Va.; University of Maryland School of Medicine, Baltimore, 1900; fellow of the American College of Surgeons; past president of the Norfolk County Medical Society; formerly city coroner; affiliated with Norfolk General Hospital, Leigh Memorial Hospital and the St. Vincent De Paul Hospital, where he died February 12, aged 72, of heart disease.

Joseph H. Kinsey, Richmond, Ind.; Physio-Medical College of Indiana, Indianapolis, 1888; member of the American Medical Association; died February 14, aged 82, of congestive heart failure.

Grover Cleveland Klein * Galesburg, Ill.; Rush Medical College, Chicago, 1912; served during World War I; member of the staff of Galesburg Cottage Hospital; died January 30, aged 64, of coronary heart disease.

Jerome Henry Leadley * Rochester, N. Y.; University of Rochester School of Medicine and Dentistry, 1930; on the staffs of the Rochester General Hospital and the Strong Memorial Hospital, where he died February 24, aged 44, of atelectasis, following an operation for esophageal ulcer.

William McCombs, Philadelphia; Jefferson Medical College of Philadelphia, 1882; for many years affiliated with Wills Hospital; died in the Temple University Hospital January 30, aged 88.

John William McCreery * Whittemore, Iowa; Drake University Medical Department, Des Moines, 1898; died February 2, aged 71, of coronary occlusion.

Orville Johnson Mason, Macedon, N. Y.; Columbian University Medical Department, Washington, D. C., 1899; member of the American Medical Association; died in Canandaigua, February 23, aged 87, of pulmonary edema due to cardiovascular disease.

John Perry Merchant, Columbus, Ohio; Ohio Medical University, Columbus, 1902; died in St. Francis Hospital February 10, aged 70, of encephalomalacia of the midbrain due to thrombosis.

Dan Hazen Moulton * Chico, Calif.; Medical Department of the University of California, San Francisco, 1902; an Associate Fellow of the American Medical Association; in charge of the health department of the Chico State College; affiliated with Enloe Hospital, where he died February 10, aged 70, of cerebral hemorrhage.

Arthur Stone Needles, Lima, Mont.; University of Michigan Department of Medicine and Surgery, Ann Arbor, 1911; member of the American Medical Association; served during World War I; died in Salt Lake City February 23, aged 63.

Dorwin Lewis Palmer * Santa Barbara, Calif.; University of Oregon Medical School, Portland, 1915; formerly associate clinical professor of radiology at his alma mater; specialist certified by the American Board of Radiology; member of the American Roentgen Ray Society; on the staff of Multnomah Hospital; died December 27, aged 60.

George Parke * Viola, Wis.; College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1905; died February 22, aged 67, of acute coronary thrombosis and arteriosclerosis.

Ernest Lawrence Parker, Cohasset, Mass.; Harvard Medical School, Boston, 1904; member of the American Medical Association; died January 18, aged 70.

Claude Lee Penington * Macon, Ga.; University of Georgia Medical Department, Augusta, 1912; specialist certified by the American Board of Otolaryngology; senior attending ear, eye, nose and throat service, Macon Hospital, where he was chairman of the executive committee; on the staff of the Middle Georgia Hospital; formerly member of the Macon hospital commission; died in the University Hospital, Augusta, February 21, aged 57, of carcinoma of the stomach.

Frank Ellsworth Peters * Winnetka, Ill.; Rush Medical College, Chicago, 1929; died in Sarasota, Fla., February 15, aged 48, of chronic glomerular nephritis, erysipelas, hypertension and congestive heart failure.

Otto Andrew George Reinhard * Lincoln, Neb.; University of Illinois College of Medicine, Chicago, 1923; specialist certified by the American Board of Internal Medicine; fellow of the American College of Physicians; formerly field director of the Siamese public health department; on the staffs of Bryan Memorial and Lincoln General hospitals; died February 12, aged 51, of coronary occlusion.

George Lewis Ross, Edinburg, Texas; Marquette University School of Medicine, Milwaukee, 1914; member of the American Medical Association and the State Medical Society of Wisconsin; died February 26, aged 64, of cerebral hemorrhage.

Harold Augustine Ryan, Miami Beach, Fla.; Columbia University College of Physicians and Surgeons, New York, 1929; member of the American Medical Association; died February 25, aged 43, of coronary thrombosis.

Harry William Schumacher * Altamont, Ill.; Washington University School of Medicine, St. Louis, 1917; served during World War I; died in the Mark Greer Hospital, Vandalia, February 18, aged 58, of coronary thrombosis.

James R. Spears, New Orleans; Flint Medical College of New Orleans University, New Orleans, 1902; died in the Flint Goodridge Hospital of Dillard University, February 18, aged 74.

Roy George Spurbeck, Cloquet, Minn.; Northwestern University Medical School, Chicago, 1911; died February 12, aged 59, of myocarditis.

Amos Osborne Squire, Ossining, N. Y.; Columbia University College of Physicians and Surgeons, New York, 1899; member of the American Medical Association; medical examiner of Westchester County from 1925 to 1948; coroner of Westchester County from 1906 to 1912; served as health officer of Ossining and as physician at Sing Sing Prison; died February 11, aged 72, of cerebral arteriosclerosis and coronary thrombosis.

William Henry Stackable, Chicago; University of Michigan Department of Medicine and Surgery, Ann Arbor, 1903; member of the American Medical Association; on the staff of St. Anne's Hospital; died February 8, aged 74, of arteriosclerotic heart disease.

Frederic Tupper Stearns, Osage, Iowa; State University of Iowa College of Medicine, Iowa City, 1942; member of the American Medical Association and of the Iowa State Medical Association; died in Mason City February 17, aged 33, of injuries received in an automobile accident.

James Gardner Strickland, Shamokin, Pa.; Jefferson Medical College of Philadelphia, 1913; served during World War I; member of the American Medical Association; formerly affiliated with the Shamokin (Pa.) State Hospital; died February 28, aged 61, of coronary occlusion.

George Linton Touchton, Savannah, Ga.; Atlanta School of Medicine, 1909; member of the American Medical Association; past president of the Georgia Medical Society; served during World War I; chief medical examiner of a draft board during World War II; formerly county physician; member of the staffs of St. Joseph and Warren A. Candler hospitals; died February 4, aged 64, of coronary occlusion.

John Edward Vallee, Van Nuys, Calif.; University of Vermont College of Medicine, Burlington, 1903; member of the American Medical Association; died February 13, aged 77, of cardiovascular renal disease.

Paul Reichard Webster * Leavenworth, Kan.; University of Kansas School of Medicine, Kansas City, 1922; on the staffs of Cushing Memorial and St. John's hospitals; died February 16, aged 51, of cerebral hemorrhage.

Francis Myron West, Lovelock, Nev.; College of Physicians and Surgeons of San Francisco, 1905; served during the Spanish-American War; died in the Veterans Administration Center, Reno, February 22, aged 76, of arteriosclerosis.

George B. Williamson, Joplin, Mo.; Missouri Medical College, St. Louis, 1887; died February 22, aged 82, of coronary thrombosis and diabetes mellitus.

Alfred Wolff, Brooklyn; Universität Heidelberg Medizinische Fakultät, Baden, Germany, 1909; member of the American Medical Association; died February 22, aged 63, of congestive heart disease.

Charles Wolff * St. Louis; St. Louis University School of Medicine, 1924; died in St. John's Hospital February 27, aged 53, of heart disease.

William S. Workman, Indianapolis; Louisville (Ky.) Medical College, 1891; member of the American Medical Association; died in Flower Mission Hospital February 13, aged 91, of pulmonary tuberculosis.

March 21, 1949.

Professor Pijper and the Bacterial Flagella

Professor Adrianus Pijper, director of the well equipped South African Institute of Pathology of the Medical Faculty, Pretoria—rather recently the *Lancet* gave a description of it—is always in close contact with his country, Holland, and never fails to send his microbiologic films to be shown in meetings of the Netherlands Microbiological Society.

Pijper's latest motion picture illustrates his theory that the flagella of bacteria do not affect the locomotion of these microbes any more than the tail of a dog affects the locomotion of this mammal. According to him the bacteria move because their bodies can make an undulating, gyrating movement. Although the spectators unanimously enjoyed the high standard of this new product of Professor Pijper's camera, it was extremely difficult to accept the theoretic view of the distinguished microbiologist from South Africa.

Kingma Boltjes made himself the interpreter of those who did not agree with Pijper, and to the observations made by Orskow, Kaufmann and others he added a few of his own. According to Boltjes even the film clearly shows that the flagella do not consist of lifeless slime matter, but are gyrating at a speed much greater than could be caused by the movement of the bacterial bodies or by currents.

Kingma Boltjes published his remarks in the Netherlands journal of microbiology and serology *Antonie van Leeuwenhoek*. Among the excellent illustrations of his short article one finds a fine picture made by Miss W. van Iterson, engineer (Netherlands Institute for Electron Microscopy at Delft). This electron photograph most convincingly shows that flagella are no artefacts, but organs of the bacterial body.

Epidemic of Lobar Pneumonia

During the war a general practitioner, Dr. F. J. Huygen, made an interesting study of an epidemic of lobar pneumonia observed by him in his country practice not far from Arnhem.

During his three years' study Dr. Huygen counted 104 cases, of which hardly any occurred during the summer months, whereas a maximum was reached in the early spring. Most cases were single ones, and this sporadic spreading seemed to be favored by crowding (large families and bad social environment).

The bacteriologic analysis made in the Hygienic Institute of the University of Utrecht (Professor Julius) revealed *Pneumococcus* type I to be the prevalent type. The same microbe was found circulating among the healthy part of the population in a high percentage (25 per cent), quite uncommon for this type of pneumococcus.

In his publication (academic thesis) Dr. Huygen finds some analogy with meningococcosis, which disease is also characterized by an outbreak of sporadic cases after the "danger line" of a high percentage of carriers has been reached.

A Cancer Healer

The Minister for Social Affairs charged the President of the Public Health Council to report to him about Dr. Jules Samuels (Amsterdam), who for many years has claimed to cure malignant tumors by a short wave treatment of the hypophysis.

Although Dr. Samuels refused to cooperate, the reporter succeeded in tracing about 70 patients who were treated in the Samuels Institute. He found that in 30 patients, who, according to Samuels, were suffering from cancer, the diagnosis could not be confirmed by any specialist. In the other cases, all confirmed by specialists, Samuels's treatment had failed. This

inquiry explains how it has been possible for Samuels to organize demonstrations of quite a number of "cured cancer patients" for colleagues on several occasions.

The medical profession is anxious to know how the Government will handle this unpleasant affair. In his report the President of the Public Health Council has declared that a physician who publicly claims that he can cure cancer and who is not able to do so "undermines the faith in the medical profession."

Vital Statistics

The "Centraal Bureau voor de Statistiek" (The Hague) lately published the first vital statistics of the year 1948.

In many respects this third year after the liberation shows exceptional conditions. Marriages and births showed high figures; mortality, infant mortality and the death rate of respiratory tuberculosis low figures, lower than any level reached before the war. The mortality rate is considered to be a world low level record. In the following summary the figures of 1936-1939, the last period of four years before the war, are also found.

	1948	1936-1939
Marriages per thousand inhabitants.....	9.0	8.0
Live births per thousand inhabitants.....	25.3	20.3
Deaths per thousand inhabitants.....	7.4	8.7
Deaths under 1 year per thousand live births....	28.5	36.9
Death from tuberculosis per 100,000 inhabitants..	21.0	32.0

FLORENCE, March 15, 1949.

Genesis and Treatment of Gastric Ulcers

At a meeting of the Academy of Sciences of Ferrara under the chairmanship of Professor Dogliotti, Professor Schiassi reported on the revised view now current concerning the genesis and treatment of gastric ulcer which, in his opinion, is justified by the increase in the incidence of this disease, by the controversial concepts which still exist with regard to pathogenesis, and by the various systems of treatment which are practiced in different countries. According to the speaker, four categories must be considered: (1) gastric ulcers resulting from epigastric trauma; these forms are very rare; (2) gastric ulcers in persons with a morbid entity localized in the nervous system, such as degeneration or tumors; these forms are merely exceptional; (3) gastric ulcers of infectious, toxic and anaphylactic origin, and (4) gastric ulcers in stigmatized persons. In the latter, neurolabile persons, the human potential of disease abides in the morphology of the patient. According to the speaker, the imponderable emotional shock descending from the cortex of the hypothalamus is transmitted by the vagus to the stomach and may upset the functions. According to Professor Schiassi, the cerebral impulse is conducted into the subdiaphragmatic region by the vagus and spreads to a nervous system which consists of a symbiosis of vagal and solar elements, so that one has no longer to deal with the vagus only or with the sympathetic nerve but with one and the other associated by a rhythmic, antagonistic and segmentary function which may become manifest in the viscus through terminal ramifications which end in the muscles and in the gastric glands.

The emotional shock communicating with this system, which the speaker has labeled "forgotten" because nobody has called attention to it, may put the antagonistic rhythm in disorder with damaging effects on the gastric tissues. This damage consists of hyperemia, ischemia, capillary hemorrhages or edema, and since it occurs in a viscus which secretes a liquid dissolvent, it constitutes a condition favorable to the development of the liquid which by its corroding activity produces ulceration. This etiologic interpretation authorizes the surgeon to intervene by interrupting the concatenation between the elements of the vago-solar system which cause the degradation of the tissues and the formation of ulcers.

Congress of Industrial Medicine

Under the chairmanship of Prof. Angelo Viziano the Fourteenth National Congress of Industrial Medicine was held in Turin and was attended by many physicians, politicians and representatives of public health, public instruction and other governmental departments. Prof. Luigi Carozzi, University of Geneva, secretary general of the permanent international commission on occupational diseases, presented the opening report on "Progress and Present Tendencies in Industrial Medicine."

The development of this discipline, from the point of view of prevention, is characterized today by a physiopsychologic and social as well as prophylactic and technical aspect, inasmuch as 90 per cent of the incapacity which causes absence from work is not of occupational origin. Among the important problems is the examination of applicants' eyesight, particularly if they are to do precision work; another important problem is that of the colors used on the walls of work rooms and for parts of the machinery, which are factors in the well-being of the workmen in their occupational environment and at the same time factors in greater production and in the prevention of accidents.

In the clinical field it is again the human factor which is dominant in the genesis of occupational diseases and of accidents during work. The preclinical latent period is of great importance in cases of occupational intoxication. Concerning the treatment with 2,3-dimercaptopropanol (BAL) recommended for many other intoxications in addition to arsenic poisoning, the author advises caution when the toxin which should be combated has a pronounced effect on the liver. Spas are in great favor for the treatment of occupational diseases. Professor Carozzi emphasized that it is the task of the physician to defend the workman against the dangers of excessive mechanization with the aim of rehumanizing work conditions.

Prof. Luigi Ferranini of Bari presented a report on "Fatigue of Respiratory Apparatus." He summarized the effects of muscular or intellectual work, of changes of temperature and of variations in atmospheric pressure on the respiratory function; the speaker analyzed the fatigue of the respiratory mechanism under conditions of strain as during singing, screaming and excitement; he presented a pathogenic interpretation of pulmonary emphysema and of hemorrhage of pulmonary parenchyma due to strain.

Professor Caccuri of Naples discussed the behavior of the cardiovascular apparatus in occupational poisoning. Professor Molino of Genoa discussed the pathologic changes and symptoms of welders using the electric arc.

Professors Ponzio, Matli and de Lorenzi were co-speakers on "The Roentgenologic Diagnosis in Factory Health Services." De Lorenzo discussed particularly the modern-fluorescent screen technic and the favorable results obtained by this means of research in thousands of workmen. Professor Ponzio reported on the apparatus and on the organization of the roentgenologic service in factories. Professor de Dominicis spoke on "Elements of Reasonable Salary," and its problems in respect to disease were presented in a report by Professor Mantovani.

Studies on Senescence

At the invitation of the International Society for Studies on Senescence with headquarters in Oxford, a National Society for Studies on Senescence has been established in Italy, the fifteenth nation which has joined the Oxford society. Prof. Maurizio Ascoli has been nominated as chairman of the new Italian society, which decided to publish a second edition of a classical work on senescence, compiled by Professor Devoto, and to distribute it to all Italian physicians. Professors Bastai and Dogliotti will be invited to bring up to date their report on old age, presented in 1938 to the Congress of Physiopathology, by enlarging it from the points of view of social

medicine and treatment. Professor di Guglielmo, with the cooperation of other scholars, will extend the research of the school of Professor Ferrata to the hematology of old age. The first congress of the new society will be held in Rome in October 1949.

BRAZIL

(From Our Regular Correspondent)

RIO DE JANEIRO, March 19, 1949.

Minimal Lesions of Pulmonary Tuberculosis in Adults

Examination of several thousands of industrial and clerical workers at the outpatient department of the Institute Clemente Ferreira in São Paulo disclosed 936 adults with minimal lesions of pulmonary tuberculosis. Of this total, 819 presented exudative lesions and 117 productive lesions. Among the former, 77.4 per cent were infiltrated and 22.6 per cent were scattered lesions. The right lung was involved in 62.4 per cent, while the left one was involved in only 37.6 per cent. Lesions were bilateral in 11.1 per cent. The most frequent localization was in the apex and the infraclavicular region (88.9 per cent). Clinical symptoms were not present in 53.9 per cent. In 94.2 per cent of patients with symptoms, clinical symptoms had lasted for not longer than one year. Examination of gastric contents showed 9.6 per cent bacteriologic positive results in patients with productive lesions and 30.9 per cent in those with exudative lesions.

One hundred and fifty-three patients not subjected to collapse-therapy were studied. Among those with exudative lesions, 60.1 per cent had progressive lesions, 10.5 per cent arrested, 2.6 per cent partially recovered, and 26.8 per cent completely recovered. In cases of productive lesions, 26.7 per cent were progressive. Seventy-four patients subjected to pneumothorax showed the following results: 27 per cent advanced, 5.4 per cent remained unchanged and 67.6 per cent showed favorable evolution.

Infections Caused by *Proteus Morgani*

Dr. Vera Leite Ribeiro of the Hospital dos Servidores do Estado, Rio de Janeiro, studied cultures recovered from feces and other material in 31 cases of dysentery in infants. Nine strains (29 per cent) possessed a specific flagellar (H) antigen, according to cross agglutination and absorption tests. Such an antigen failed to appear in other *Proteus morgani* cultures occurring in normal feces of healthy persons, as well as in patients suffering from well known *Shigella* or *Salmonella* infections. All cases showing presence of special H antigen *P. morgani* cultures the conditions were recognized as pathologic by both clinical investigation and postmortem examination (6 cases were fatal). Circulating antibodies (specific H agglutinins) were also found in a patient with a chronic condition who had a specific *P. morgani* strain in the feces.

Activity of Adrenal Cortical Extract by Oral Administration

Effectiveness of corticoadrenal extracts when given parentally has been demonstrated. In a recent study, Dr. Maria I. Mello, of the Division of Chemistry and Pharmacology of the Oswaldo Cruz Institute studied the effects produced by this extract when given orally and subcutaneously. Four different methods were tried. Oral administration was by stomach tube. Corticoadrenal extracts employed in the study were prepared by the Swingle and Pfiffner technic. The extract was given as total extract and as a charcoal adsorbate. Adrenalectomized rats treated by the oral preparations responded better to the charcoal adsorbate than to the total extract. The glycogen liver deposition test of Britton and Silvette and the Grollman test were used to measure results. Responses obtained with the adsorbate were similar to those obtained from injected

extracts. All animals received the same dose of the cortical extract, and all the groups used for the tests were maintained under identical conditions.

Lepromin Reaction in Healthy Noncontact Persons

Drs. Abraão Rothberg and N. Souza Campos, of the Division of Leprosy, São Paulo State Department of Health, performed the lepromin test in 163 adults and 94 children. All were healthy residents of São Paulo. These persons spent all or almost all their lives in the city or in rural sections of the state where leprosy is endemic. They had no known direct contact with cases of the disease. Some of the adult group also were tested by the Mantoux reaction with 1:10,000 dilution of tuberculin. Both the early Fernandez reaction and the late Mitsuda reaction were frequently found positive in adults. Negative results were frequently observed in the children. Usually agreement occurred in results of the early and the late lepromin reactions both in positivity and negativity, but in many Fernandez-negative cases a late Mitsuda positive reaction was observed.

Comparison with Mantoux tests supports the opinion that the tuberculin sensitization influences the early lepromin reaction. The late lepromin reaction did not seem to be influenced by tuberculin sensitization.

Medical Examinations and Licensure

COMING EXAMINATIONS AND MEETINGS

NATIONAL BOARD OF MEDICAL EXAMINERS

NATIONAL BOARD OF MEDICAL EXAMINERS: *Parts I and II*. Various Centers, June 20-22, Sept. 12-14. *Part III*, June, various centers. Exec. Sec., Mr. E. S. Elwood, 225 S. 15th St., Philadelphia 2.

EXAMINING BOARDS IN SPECIALTIES

AMERICAN BOARD OF ANESTHESIOLOGY, Inc. *Written*. Various Centers, July 15. *Oral*, Oct. 16-20. Sec., Dr. Curtiss B. Hickcox, 745 Fifth Ave., New York 27.

AMERICAN BOARD OF INTERNAL MEDICINE: *Oral*, Philadelphia, June 1-3. *Written*, Oct. 17. Asst. Sec.-Treas. Dr. W. A. Werrell, 1 Main St., Madison 3, Wis.

AMERICAN BOARD OF NEUROLOGICAL SURGERY: *Oral*, Chicago, June 1949. Sec., Dr. W. J. German, 310 Cedar Street, New Haven, Conn.

AMERICAN BOARD OF OPHTHALMOLOGY: *Oral*, New York, June 11-15; St. Louis, Oct. 15-19; Boston, December. Sec., Dr. S. J. Beach, 56 Ivie Rd., Cape Cottage, Maine.

AMERICAN BOARD OF ORTHOPAEDIC SURGERY. *Part II*, New York City, Jan. 1950. Final date for filing application for Part II is Aug. 15. Address: Dr. Francis M. McKeever, 1136 W. 6th St., Los Angeles 14, Calif.

AMERICAN BOARD OF OTOLARYNGOLOGY: Chicago, Oct. 4-7. Sec., Dr. D. M. Lierle, University Hospital, Iowa City.

AMERICAN BOARD OF PEDIATRICS: *Written*. Under local monitors, June 24. *Oral*, Cleveland, Sept. 16-18; New York City, Oct. 21-23; Chicago, Dec. 9-11. Sec., Dr. John McK. Mitchell, 6 Cushman Road, Rosemont, Pa.

AMERICAN BOARD OF PHYSICAL MEDICINE. Philadelphia, June 4-5. Sec., Dr. R. L. Bennett, 30 N. Michigan Blvd., Chicago.

AMERICAN BOARD OF PLASTIC SURGERY: Examinations are given in June and November of each year in the home town of applicants. Sec.-Treas., Dr. Louis T. Byars, 400 Metropolitan Bldg., St. Louis, Mo.

AMERICAN BOARD OF PSYCHIATRY AND NEUROLOGY, Inc. *Special Examination*, October. Place to be announced. Final date for filing application is July 15. December, New York City. Sec. Dr. F. J. Braceland, 102-110 Second Ave., S.W., Rochester, Minn.

AMERICAN BOARD OF RADIOLOGY. Atlantic City, June 2-4. Sec., Dr. B. R. Kirklin, 102-110 Second Ave., S.W., Rochester, Minn.

AMERICAN BOARD OF SURGERY: *Written*. Various Centers, October 26. Final date for filing application is July 1. Sec., Dr. J. Stewart Rodman, 225 S. 15th St., Philadelphia.

AMERICAN BOARD OF UROLOGY: *Written*, December. *Oral and Clinical*, Chicago, Feb. 11-15. Final date for receipt of case histories is Sept. 1, 1949. Sec., Dr. Harry Culver, 7935 Sunnyside Road, Minneapolis 18, Minn.

BOARDS OF MEDICAL EXAMINERS

ALABAMA: *Examination*. Montgomery, June 28-30. Sec., Dr. D. G. Gill, 519 Dexter Ave., Montgomery.

ARKANSAS: * Little Rock, June 9-10. Sec., Dr. L. J. Kosminsky, Texarkana. *Eclectic*. Little Rock, June 9-10. Sec., Dr. C. H. Young, 1415 Main St., Little Rock.

CALIFORNIA: *Examination*. San Francisco, June 21-23. Sec., Dr. Frederick N. Scatena, 1020 N St., Sacramento.

COLORADO: * *Examination*. Denver, June 20-22. Sec., Dr. W. W. King, 831 Republic Bldg., Denver.

DELAWARE: Dover, July 12-14. Sec., Dr. J. S. McDaniel, 229 South State St., Dover.

FLORIDA: * *Examination*. Jacksonville, June 26-28. Sec., Dr. Frank D. Gray, 12 N. Rosalind Ave., Orlando.

GEORGIA: *Examination*. June 8-9, Atlanta and Augusta. *Reciprocity*. Atlanta, June. Sec., Mr. R. C. Coleman, 111 State Capitol, Atlanta.

GUAM: *Endorsement*. Agaña, Last Friday of each month. Sec., Capt. C. K. Youngkin, Dept. of Public Health, Guam. % F.P.O., San Francisco, Calif.

HAWAII: * *Examination*. Honolulu, July 11-14. Sec., Dr. S. E. Doolittle, 881 S. Hotel St., Honolulu.

IDAHO: Boise, July 11-13. Sec., Miss Estella S. Mulliner. Bureau of Occupational Licenses, 355 State House, Boise.

INDIANA: *Examination*. Indianapolis, June 21-23. Sec. Board of Medical Registration and Examination. Dr. Paul R. Tindall, 416 K. of P. Bldg., Indianapolis.

IOWA: * *Examination*. Iowa City, June 13-15. Sec., Dr. M. A. Royal, 506 Fleming Bldg., Des Moines.

KANSAS: Kansas City, June 1-2. Sec., J. F. Hassig, 905 North 7th St., Kansas City, Kans.

KENTUCKY: *Examination*. Louisville, June 15-17. Sec., Dr. Bruce Underwood, 620 S. 3rd St., Louisville 2.

MAINE: Augusta, July 5-6. Sec., Dr. Adam P. Leighton, 192 State St., Portland.

MARYLAND: *Examination*. Baltimore, June 21-24. Sec., Dr. Lewis P. Gundry, 1215 Cathedral St., Baltimore. *Homoeopathic*. Baltimore, June 14-15. Sec., Dr. John A. Evans, 612 West 40th St., Baltimore.

MASSACHUSETTS: *Written*. Boston, July 12-15. Sec., Dr. George L. Schadt, 413 E. State House, Boston.

MICHIGAN: * *Written*. Detroit and Ann Arbor, June 13-15. Sec., Dr. J. Earl McIntyre, 203 Hollister Bldg., Lansing.

MISSISSIPPI: Jackson, June 21-22. Asst. Sec., Dr. R. N. Whitfield, State Board of Health, Jackson.

MISSOURI: *Examination*. St. Louis, May 30-31 and June 8-10. Exec. Sec., Mr. John A. Hailey, Box 4, Jefferson City.

MINNESOTA: * Minneapolis, June 21-23. Sec., Dr. Julian F. DuBois, 230 Lowry Medical Arts Bldg., St. Paul 2.

MONTANA: Helena, Oct. 3-5. Sec., Dr. Otto G. Klein, First National Bank Bldg., Helena.

NEBRASKA: * *Examination*. Omaha, June 6-8. Dir., Bureau of Examining Boards, Mr. Oscar F. Humble, 1009 State Capitol Building, Lincoln 9.

NEW JERSEY: *Examination*. Trenton, June 21-24. Sec., Dr. E. H. Hallinger, 28 West State Street, Trenton 8.

NEW YORK: Albany, Buffalo, New York and Syracuse, June 28-July 1. Sec., Dr. Jacob L. Lochner, 23 South Pearl St., Albany.

NORTH CAROLINA: *Examination*. Raleigh, June 23-25. Sec., Dr. Ivan Proctor, 226 Hillsboro St., Raleigh.

NORTH DAKOTA: * *Written*. Grand Forks, July 5-7. *Reciprocity*. Grand Forks, July 8. Sec., Dr. C. J. Glaspel, Grafton.

OHIO: *Examination*. Columbus, June 15-18. *Endorsement*, Columbus, July 5. Sec., Dr. H. M. Platter, 21 W. Broad St., Columbus.

OKLAHOMA: * Oklahoma City, June 8-9. Sec., Dr. Clinton Gallaher, 813 Braniff Bldg., Oklahoma City.

PENNSYLVANIA: *Examination*. Philadelphia and Pittsburgh, July. Acting Sec., Mrs. B. G. Steiner, 351 Education Bldg., Harrisburg.

PUERTO RICO: San Juan, Sept. 6-10. Sec., Dr. Luis Cueto Coll, Box 3717, Santurce.

RHODE ISLAND: * *Examination*. Providence, July 7-8. Chief, Mr. Thomas B. Casey, 366 State Office Bldg., Providence.

SOUTH CAROLINA: *Examination*. Columbia, June 27-29. *Endorsement*. Columbia, June 27-28, Aug. 1, Sept. 5 and Oct. 3. Sec., Dr. N. B. Heyward, 1329 Blanding St., Columbia.

SOUTH DAKOTA: * *Examination*. Pierre, July 19. Sec., Dr. G. J. Van Heuvelen, Capitol Bldg., Pierre.

TEXAS: *Examination*. Austin, June 16-18. Sec., Dr. M. H. Crabb, 209 Medical Arts Bldg., Fort Worth 2.

UTAH: *Endorsement*. Salt Lake City, May 25. *Examination*, Salt Lake City, July 13-15. Sec., Dept. of Registration, Miss Rena B. Loomis, 324 State Capitol Bldg., Salt Lake City.

VIRGINIA: *Examination*. Richmond, June 17-18. *Reciprocity*. Richmond, June 16. Dr. K. D. Graves, 631 First St., S.W., Roanoke.

WASHINGTON: * Seattle, July. Sec., Mr. Edward C. Dohm, Department of Licenses, Olympia.

WISCONSIN: * *Examination*. Milwaukee, June 28-30. Sec., Dr. C. A. Dawson, Tremont Bldg., River Falls.

WYOMING: Cheyenne, June 20. Sec., Dr. Franklin D. Yoder, Capitol Bldg., Cheyenne.

* Basic Science Certificate required.

BOARDS OF EXAMINERS IN THE BASIC SCIENCES

ALASKA: Feb. 1950. Sec., Dr. C. Earl Albrecht, Box 1931, Juneau.

ARIZONA: Tucson, June 21. Sec., Mr. Francis A. Roy, Science Hall, University of Arizona, Tucson.

COLORADO: *Examination*. Denver, June 1-2. Sec., Dr. Esther B. Starks, 1459 Ogden St., Denver.

CONNECTICUT: New Haven, June 11. Exec. Asst., State Board of Healing Arts, Miss Mary G. Reynolds, 110 Whitney Ave., New Haven 10.

FLORIDA: *Examination*. Gainesville, June 11. Sec., Mr. M. W. Emmel, University of Florida, Gainesville.

MINNESOTA: *Examination*. June and Oct. Sec.-Treas., Dr. Raymond N. Bieter, 105 Millard Hall, Univ. of Minnesota, Minneapolis.

OREGON: Portland, June 18, Sept. 3 and Dec. 3. Sec., Mr. Charles D. Byrne, State Board of Higher Education, Eugene.

SOUTH DAKOTA: Vermillion, June 3-4. Dr. G. M. Evans, 310 E. 15th St., Yankton.

TENNESSEE: Memphis, July 8-9. Sec., Dr. O. W. Hyman, 874 Union Ave., Memphis 3.

WISCONSIN: Milwaukee, June 4, Sept. 24 and Dec. 3. Sec., Prof. W. H. Barber, Ripon College, Ripon.

Council on Medical Education and Hospitals

COOPERATIVE PLAN FOR THE APPOINTMENT OF INTERNS

The following new agreement for internship appointments has been approved by the Association of American Medical Colleges, the Council on Medical Education and Hospitals of the American Medical Association and the American Hospital Association.

This plan for 1949 will apply only to undergraduate students in the fourth year of their medical school course.

Application for Internships.—1. Applications are to be filed with the hospitals beginning on the third Tuesday in October (Oct. 18, 1949).

2. Application should be made in duplicate; the original to be forwarded to the dean of the applicant's medical school for transmission together with credentials to the hospital or hospitals of the applicant's choice; the second copy to be mailed directly to the hospital or hospitals by the applicant.

3. The application may be accompanied by letters of recommendation from faculty members. Such letters of recommendation shall not be routinely requested by hospitals.

4. The number of applications filed shall not be limited in number.

Tendering of Internship Appointments.—1. The tendering of internship appointments by hospitals shall be made by telegram. No telegram shall be sent which will arrive prior to 12:01 a. m. of the third Tuesday in November (Nov. 15, 1949). Telegrams may be filed in advance for delivery at 12:01 a. m.

Applicants may visit hospitals and be interviewed by the intern committee, but the hospital or its representative shall not commit the hospital or the applicant before Nov. 15, 1949.

2. Hospitals may notify alternates of their status at the same time and in the same manner as their first choice candidates.

Acceptance of Appointments.—1. Acceptance of appointments should be made promptly. Applicants should be allowed a reasonable period of time to consider appointment offers, but no specified waiting period after 12:01 a. m. is obligatory.

2. On acceptance of an appointment, prompt notification of withdrawal of applications to other hospitals which have offered appointments should be made.

1950 GRADUATES OF THE UNIVERSITY OF WASHINGTON SCHOOL OF MEDICINE

The Council on Medical Education and Hospitals has ruled that students who will graduate from the University of Washington School of Medicine in 1950 will be considered for purposes of internship appointment as if they had graduated from an approved medical school. Hospitals approved for intern training will not lose their approved status if they accept these students for internships.

Since its organization, the development of the University of Washington School of Medicine has been followed closely by the Council. In accordance with long-standing policy, however, approval is not granted any medical school until representatives of the Council survey the school after instruction has been instituted in all four years of the medical course. The first senior class at the University of Washington will not be enrolled until the fall of 1949. Inspection of the school, therefore, cannot be carried out in time to include the findings of the survey in the 1949 Educational Number of THE JOURNAL, which will be used by hospitals for determining whether applicants for internships are graduates of approved medical schools.

If the University of Washington School of Medicine is included on the Council's approved list in 1950, the work of all students in good standing at the school at the time the Council's representatives survey the school will be fully accredited.

GRADUATE TRAINING PROGRAMS ACCEPTABLE BY THE AMERICAN BOARD OF PSYCHIATRY AND NEUROLOGY

The Council on Medical Education and Hospitals has limited its approval of programs for graduate training to those offered in connection with general or special hospitals. The following information is published, however, at the request of the American Board of Psychiatry and Neurology to indicate the availability of a special type of training which is acceptable to the board and carries full credit toward certification by that board.

Requirements for Acceptance

In order to facilitate the arrangements for training in child psychiatry (which constitutes a major aspect of modern psychiatry), the American Board of Psychiatry and Neurology will accept one year of training in psychiatric clinics for children which may or may not be a part of a hospital approved for residency training, provided such a clinic gives adequate supervision and instruction for full time training during the entire third year of the required three year formal training period. For the purpose of evaluating such clinics, the following conditions and criteria are deemed essential by the American Board of Psychiatry and Neurology:

1. That the clinic have a full time medical director, psychologist, and social worker qualified by training and experience in child psychiatry and allied fields to supervise the training of residents.

2. That the major portion of such training be devoted to therapy adequately supervised by this qualified staff.

3. That the service and teaching activities of the clinic be integrated with those of the community and its social agencies.

4. That clinic work be supplemented by seminars, case conferences, journal clubs or other opportunities for the discussion of the basic principles involved in outpatient work with children and parents, teacher, public health and welfare agency personnel.

5. That such a training clinic be well established in the community with a qualified staff that has operated together long enough as a team to insure stable and sound functioning.

6. That the senior members of the clinic team show evidence of previous experience in the teaching of psychiatry in general, child psychiatry in particular, and their allied fields.

These criteria set forth by the Board pertain more particularly to community-sponsored clinics offering full time training in child psychiatry during the third year of formal residency training. If these clinics are affiliated with hospitals already maintaining approved programs, separate approval is not required unless warranted on the basis of their meeting all requirements for straight fellowship training in child psychiatry.

The following clinics are acceptable to the American Board of Psychiatry and Neurology as qualifying under these provisions.

Center	Director
Children's Psychiatric Division, Langley-Porter Clinic, San Francisco	Dr. Stanislaus Szurek
Institute for Juvenile Research, 907 S. Wolcott Ave., Chicago	Dr. Sophie S. Sloman
Louisville Mental Hygiene Clinic and Child Study School, 610 S. Floyd St., Louisville, Ky.	Dr. Spafford Ackerly
The Guidance Center, 1737 Prytania St., New Orleans	Dr. Milton E. Kirkpatrick
The Psychiatric Clinic of the Mental Hygiene Society of Maryland, Baltimore	Dr. H. Whitman Newell
Children's Center, 244 Townsend St., Roxbury, Mass.	Dr. Marian Putnam and Mrs. Beata Rank, co-directors
Judge Baker Guidance Center, 38 Beacon St., Boston	Dr. George E. Gardner
Amherst H. Wilder Clinic, 279 Rice St., St. Paul	Dr. Hyman S. Lippman
Central Clinic, Cincinnati General Hospital, Cincinnati	Dr. Maurice Levine
Child Guidance Clinic, 1711 Fitzwater St., Philadelphia 46	Dr. Frederick H. Allen
Pittsburgh Child Guidance Clinic, 3004 Victoria St., Pittsburgh 13	Dr. Harry M. Little
Children's Service Center of Wyoming Valley, 335 South Franklin St., Wilkes-Barre, Pa.	Dr. J. Franklin Robinson

RESIDENCY TRAINING IN RADIOLOGY

A survey of hospitals approved for residency training in radiology is contemplated by the American Board of Radiology, in cooperation with the Council on Medical Education and Hospitals. This survey will include those hospitals which are presently fully approved, approved on a temporary basis or have applied for approval.

According to a recent announcement of the board regarding its plans, the inspection work will require the assistance of forty to fifty radiologists who will visit the radiology department of each hospital included in the survey. The board has estimated that the project will require several months to complete.

Medical Motion Pictures

FILM REVIEWS

Fractures, An Introduction. 16 mm., color, sound, 1,000 feet (1 reel), showing time twenty-six minutes. Prepared in 1948 by The American College of Surgeons under the medical supervision of Harrison L. McLaughlin, M.D., New York. Produced by Eddie Albert Productions, Hollywood, under a grant by and procurable on loan from the Johnson & Johnson Research Foundation, Orthopedic Division, New Brunswick, N. J.

This motion picture deals with fundamental concepts of fractures and by means of specific examples, well chosen to illustrate certain common types, forcefully drives home lessons of physiology, pathology and treatment.

It begins with the actual mechanism of fracture, such as by tripping and falling on an outstretched hand, depicting certain fractures that may occur from such injury. Effects on the body as a whole are stressed; the possible injuries distant from the fracture, the adjacent soft tissue involvement and the elements that contribute to the displacement of the fragmented bones. Recognition of the associated pathologic changes is emphasized and treatment illustrated. Consideration is given to the patient as an individual who has a specific job awaiting his return.

Several common types of fractures are shown in detail. Physiology of repair according to present concepts is demonstrated. The necessity for obtaining desirable alignment and immobilization is depicted. Examples of the unsatisfactory results which may occur without proper treatment are illustrated. Actual manipulations on a patient are seen during reduction of a fracture of the upper extremity. Brief mention is made of the desirability of various forms of traction for certain fractures and the occasional necessity for open reduction and fixation. Since it is a fundamental teaching film the more specialized methods of fracture treatment are properly kept in the background.

The application of plaster splints and the follow-up care of a patient wearing plaster are seen. Common complications of plaster immobilization are mentioned and treatment illustrated. The patient is seen exercising various parts of the body to gain strength and improve motion, and the interest of the surgeon in returning the patient to his position in as perfect condition as possible is evident.

This film is an excellent example of what can be done to improve the teaching of fracture treatment. It could well be used at the beginning course in fractures and repeated at the end of the course. In order to expand on certain points and to deviate toward more specific treatment, it would have been valuable to have a set of slides accompany the film.

From a production standpoint, the film is well done in every respect. The animation and roentgen reproductions are especially good.

The success of this film should encourage the production of other films showing in detail the various forms of traction, internal fixation, treatment of malunions and nonunions and other elements concerned in fracture treatment.

Supracondylar Leg Amputation. 16 mm., color, silent, 290 feet, showing time thirteen minutes. Prepared in 1947 by and procurable on loan or purchase from Philip Thorek, M.D., 25 East Washington Street, Chicago 2.

This is a record type film showing a supracondylar type of leg amputation in which a simple circular incision is utilized without attempt to form flaps. Each structure is individually isolated, ligated and severed.

The type of amputation is relatively common with a few modifications of the surgeon demonstrating the procedure. The strong points of the film are the excellent dissection of the soft tissues and careful exposure of each structure. The careful handling of all tissues is commended.

The weak points of the film from the technical side are the excessive showing of hemostats and suturing, the photographing of many heads and hands that obstruct the view of the actual

work and the extraneous material photographed in the background.

The professional objections might be listed as: (1) the use of a film on amputation without even a tourniquet's being shown available in case of necessity; (2) the unnecessary length of exposure and time consumed in detailed work that could be done rapidly without unnecessarily endangering the operative procedure; (3) the use of nonabsorbable suture material throughout, which in many operations might be contraindicated; (4) placing of the resultant scar on the distal end of the stump, which is not always the best place for a scar for modern types of prosthesis; (5) the use of alcohol injections into the nerve trunk, which is open to question in modern amputation, and (6) the treatment of the periosteum at the distal end of the amputation stump, which is opened to some technical questioning.

This film would be best viewed by specialists who could properly evaluate the advantages and disadvantages of the material depicted. It is not recommended for general practitioners, residents, interns or medical students, who, because of limited experience in amputations, might not be able to evaluate the material properly. It contributes little to the present knowledge of amputations and because of its individual approach to the subject has the inherent danger of formulating ideas that may not stand the test of time.

Portacaval Shunt for Portal Hypertension. 16 mm., color, silent, 425 feet (1 reel), showing time fifteen minutes. Prepared in 1948 by and procurable on loan or purchase from Philip Thorek, M.D., 25 East Washington Street, Chicago 2.

The operative procedure used in end to side portacaval shunt on a patient with a diagnosis of cirrhosis of the liver associated with ascites is illustrated. There is no mention of bleeding esophageal varices, which is generally felt as the real indication for this operative procedure. In this case the liver did not appear too severely damaged and the ascites not extreme. Good medical management will greatly relieve many of these patients, particularly if sufficient protein is given to elevate the plasma albumin to a normal range; if this is accomplished, the ascites can be controlled. This treatment should have been tried on the patient, although little knowledge of the past history is given in the picture.

The operative technic is not well shown. Some of the finer technical details are skipped, such as the anastomosis between the open end of the portal vein and the side of the vena cava. Mention is not made of the end results.

From a photographic standpoint, the color quality is good; however, in several scenes the surgical field is not centered on the screen. A better camera angle would have shown some of the technics more clearly, especially those in the deeper cavities.

This film cannot be recommended as a teaching aid.

Supra-Aortic Esophagogastrostomy for Carcinoma of the Midportion of the Esophagus. 16 mm., color, silent, 975 feet (3 reels), showing time thirty-eight minutes. Prepared in 1948 by and procurable on loan or purchase from Philip Thorek, M.D., 25 East Washington Street, Chicago 2.

This film shows in detail surgical removal of a carcinoma of the midportion of the esophagus and the technic of mobilization of the stomach and its anastomosis to the remaining supra-aortic portion of the esophagus. The history, roentgenograms and esophagoscopy findings are briefly presented. The surgical procedure illustrating the actual technical phases and important steps of the operation are outlined, and landmarks are well depicted. The patient is shown on succeeding postoperative days and on the tenth postoperative day eating a liquid and soft diet without difficulty. Roentgenograms taken before and after operation are shown.

While this is a long complicated operation involving many separate steps, the film is possibly a little too long. Judicious editing would not destroy the purpose of the film.

This production should be suitable for general surgeons, otolaryngologists, residents and interns.

The field wanders on the screen; otherwise the photography is good.

Bureau of Legal Medicine and Legislation

MEDICOLEGAL ABSTRACTS

Health Departments: Right to Reimburse Executive for Expenses at Medical Meeting.—The Louisville and Jefferson County Board of Health reimbursed one of its executives for expenses incurred in attending a meeting of the Southern Branch of the American Health Association held in Memphis, Tenn. The board contended that it was necessary for certain of its executives and employees to make outstate trips in attending such meetings to obtain and collect information regarding public health practices, that this travel was undertaken by its executives and employees to qualify and equip themselves more fully and intelligently to carry out the duties demanded by the public health of the community, that the trip was for public purposes and benefits and that the information thus obtained was utilized in public health administration. The trial court held that the board was without authority to pay the expenses of its members or employees in attending medical meetings, schools, institutions or conferences to better qualify themselves to discharge their duties. From this judgment the board appealed to the Court of Appeals of Kentucky.

The defendant board was created as a city-county board of health, and the statute creating it provided, among other things: "The board may expend funds for the purpose of conducting research work, including laboratory and biometrical work, and establishing, erecting and maintaining laboratories and other buildings and all appurtenances thereto for research work as to the prevalence, causes, cure and prevention of disease, and to that end the board is authorized to expend funds in the employment of such persons or organizations, scientists or research experts as the board may deem proper. The board shall be charged with the responsibility for the collection from official and other sources and for the publication of such statistics and information as may be useful and necessary for the performance of its duties. . . ."

The board admits, said the Court of Appeals, that all of its power is derived from the legislature and that there is no specific statutory authorization for reimbursement to its executives or employees of expenses incurred in attending medical meetings and conventions in search of information on health. If such expenses are legitimate, continued the court, they arise by necessary implication in carrying out expressly conferred powers. The excerpt quoted herein authorizes the board to expend funds for the purpose of conducting research work and charges it with responsibility for the collection and publication from official and other sources of such statistics and information as may be useful in the performance of its duties. These and other broad powers conferred on the board by the statute, the court continued, come very near expressly authorizing it to pay the expenses of its officers and personnel in attending medical meetings. Certainly, by necessary implication, the statute authorizes this expenditure, since there is hardly any other practical way whereby the information can be obtained by public health officers except in attending such medical meetings. It may be argued that they could remain at home and gather this information by reading medical journals and the proceedings of meetings held by doctors. But it is common knowledge that hearing some eminent specialist lecture, engaging him in conversation thereafter and seeing him demonstrate and put into practice his theory, is much more enlightening than reading of it in a journal. It appears that at the meeting in question there was a discussion on the common problems of health administration by the board's representative with other members who attended a symposium on hospital and sanitary construction; also, he attended another symposium on tuberculosis, its control in urban and rural communities; another on public health administration, and another on recruiting and training of public health personnel.

The record showed that of an appropriation of \$1,877,000 for the fiscal year there had been expended in outstate travel up

to the time of the filing of the suit in May only the sum of \$1,603. Therefore, said the court, it can hardly be said that the board was allowing an unusual amount of its budget to be spent in outstate travel in collecting information and statistics relative to their duties as public health officers. It appeared that a resolution was adopted by the board providing that travel allowance could be approved only if directed by the Director of Health. The expense was limited to \$10 per day and actual railroad fare, and 25 per cent of the entire expense had to be borne by the person making the trip. This resolution, said the court, is persuasive that the board intended to see that no abuse occurs in outstate travel. However, should abuse arise, then an aggrieved party has access to the courts. So in the case at bar, the court concluded, when the legislature authorized the board to "expend funds for . . . research" and charged it with the responsibility "for the collection from official and other sources and for the publication of such statistics and information as may be useful and necessary for the performance of its duties," the necessary implication is that the board may bear the expense of its officers and employees in attending medical meetings outside of the state where such research information and statistics may be found. Accordingly the judgment denying the expenditure was reversed. *Louisville and Jefferson County Board of Health v. Steinfeld*, 215 S. W. (2d) 1011 (Ky., 1948).

Malpractice: Surgeon's Liability for Nurse's Actions.—This was an action for damages resulting from the alleged negligence of the defendant physician. From a verdict and judgment for the defendant, the plaintiff appealed to the court of appeals of Ohio, Hamilton County.

The defendant physician operated on the plaintiff to remove an abscess from the lung. To do this, it was necessary to pack the pleural cavity with paraffin to prevent the infection from spreading when the abscess was opened. A later operation was performed to drain the abscess and remove the paraffin, and it was in connection with this second operation that it was asserted that the defendant was negligent. In performing this operation either of two types of electrical machines could be used, each requiring a different technic. The defendant physician instructed the hospital attendants to prepare an operating room and supply a Davis Bovie machine. When he arrived at the assigned room, he found a Davis Bovie machine was there, proceeded to test it, found that it was in good working condition and then repaired to the scrub room to prepare for the operation. After rendering himself antiseptic, he immediately went back to the operating room, where he found the plaintiff draped for the operation and the electrical machine in position, but as usual hidden from view of the surgeon by a screen between it and the operating table, excepting the attachments used by him in performing the operation. As a matter of fact, while the defendant was in the scrub room, attendants of the hospital had removed the Davis Bovie machine and substituted therefor a Fisher machine. The defendant was not informed of this substitution and proceeded with the operation as though with a Davis Bovie machine. The result was that the plaintiff received a severe third degree burn on the outer surface of the right thigh, where his leg rested on the electrode of the machine.

The plaintiff argued that even if the defendant could not be charged with personal knowledge that a Fisher machine had been substituted for the Davis Bovie machine, the scrub nurse knew of the substitution and her knowledge was attributable to the defendant as a matter of law. She was an employee of the hospital, said the court, charged with the duty of preparing the room and the instruments and of supplying the instruments to the surgeon during the progress of the operation. The defendant had no right to direct as to the mode or manner of preparing the room for the operation.

We are of the opinion, concluded the court of appeals, that the scrub nurse was not in any sense an employee of the defendant in the task of preparing the room preceding the actual beginning of the operation and that whatever negligence occurred in that connection cannot be attributed to the surgeon. Accordingly, the judgment of the trial court in favor of the physician was affirmed. *Clary v. Christiansen*, 83 N. E. (2d) 64 (Ohio, 1948).

Current Medical Literature

AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1938 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied by stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (*) are abstracted below.

Quinidine Sulfate for Hiccup.—Bellet and Nadler report on the use of quinidine in 9 cases of hiccup. Quinidine stopped the paroxysms in 6 cases, was partially successful in 2 and failed in 1 case. The usual methods of treatment had been tried in most of these patients without success. The authors are not certain as to the dose of the drug and frequency of administration which may be necessary to stop a paroxysm. It is suggested that an initial dose of 10 grains (0.6 Gm.) preferably given by the intramuscular route, be repeated hourly for three to four doses. If the paroxysm stops, the patient may be put on a maintenance dose of 5 grains (0.3 Gm.) orally every two to three hours. If the paroxysm recurs, the initial high doses should be repeated. The authors feel that quinidine could stop a paroxysm of hiccup in two ways: (1) by a direct effect of the drug on the diaphragm as well as on the muscles of respiration, and (2) by blocking the nerve impulses at the myoneural junction. There is some suggestive evidence that this drug may have a direct effect on nerve tissue which may block impulses through the vagus and other nerves.

Brucellosis and Multiple Sclerosis.—According to Kyger and Haden acute brucellosis may produce meningitis, encephalitis and encephalomyelitis. They have reviewed 560 cases of chronic brucellosis to determine the frequency of neurologic symptoms. Their observations suggest that multiple sclerosis might be a central nervous system manifestation of chronic brucellosis. In order to investigate this hypothesis, 118 consecutive patients with multiple sclerosis were subjected to skin tests with Brucella antigens. The skin tests indicate a high degree of cutaneous reactivity to Brucella antigens. The authors also point out that areas of greatest frequency of multiple sclerosis in the United States are in the Pacific Northwest and in the Great Lakes basin; brucellosis of the abortus type is prevalent in these same areas. The question arises as to whether the concept of brucellosis as an etiologic agent in multiple sclerosis is compatible with the pathogenesis of the latter disorder. Andren contends that neither the possibility of local allergy nor the theory of virus etiology necessarily

precludes the possibility of vasoconstriction or vascular occlusion as the basic mechanism in multiple sclerosis. The same statement could be applied to brucellosis; perivascular infiltration and small vessel thromboses have been noted as basic components of the granulomatous lesions produced by it. The plaque-like lesions seen in cases of Brucella chorioretinitis are certainly comparable to the plaques of multiple sclerosis, and both chorioretinitis and iritis have been seen in a few of the patients of this study.

Endometriosis Causing Ileal Obstruction.—McGuff and his associates of the Mayo Clinic analyzed the clinical data on 16 cases in which ileal obstruction was caused by endometriosis. Three of these cases are from their clinic and 13 are cited from the literature. They stress the following as important factors in the diagnosis of endometriosis causing ileal obstruction: (1) sterility of more than ten years' duration, (2) increasing acquired dysmenorrhea, (3) menstrual periodicity in the symptoms of endometriosis and moderately progressive ileal obstruction and (4) the presence, in half of the cases, of tender nodules in the cul-de-sac of Douglas or along the uterosacral ligaments, or of uterine fibroids or ovarian cysts. Obstruction of the distal part of the ileum by endometriosis often has been thought clinically to be appendicitis accompanied by ileus. The symptoms of endometriosis can be elicited if a thorough history is taken. The treatment of choice in ileal obstruction caused by endometriosis is ileal resection, with or without preliminary ileocolostomy or enterostomy and with or without bilateral oophorectomy and/or hysterectomy, as indicated by the presence and degree of the associated pelvic pathologic processes. Ileal obstruction was found to be due, usually, to kinking caused by the adhesions of endometriosis and, to a lesser degree, to the impingement of the endometrioma into the intestinal lumen. Endometriomas of the ileum were more superficial in location than those of the pelvic part of the colon. Endometrial glands and stroma were found in all layers of the intestinal wall except the mucosa, more prominent in the muscularis propria and the serosa. Histologic examination of frozen sections of tissue and pathologic confirmation of endometriosis as the cause of ileal obstruction are imperative, because a malignant process can be excluded only by this procedure.

Diagnosis of Genital Cancer by Vaginal Smears.—Kernodle and his associates say that smears are being taken from all new patients who come to the obstetric and gynecologic clinic of Duke University. Vaginal and cervical smears, and

frequently endocervical or endometrial smears are made. So far 6,753 smears have been studied from 1,709 patients. Malignancy was diagnosed by means of the smear technic of Papanicolaou and Traut in 114 of the 124 in whom cancer was verified by pathologic studies; that is, the percentage of error was 8.1. False positive diagnoses were made in 34 of 1,585 patients; a percentage error of 2.1. Case histories of 9 patients are given to illustrate the diagnosis of genital carcinoma by the vaginal smear method. These include squamous cell carcinoma of the cervix, 5; squamous cell carcinoma of the vulva, 1; sarcoma of the uterus, 1, and chorionepithelioma, 1. Those patients having squamous cell carcinoma of the cervix show that the diagnosis of cancer sometimes may be made earlier by smears than by the biopsy method. Primary adenocarcinoma of the oviduct was revealed in the vaginal smears of one patient. One patient with adenocarcinoma of the endometrium in which smears were negative even when they were obtained from the tumor surface is reported to show weakness of the smear method.

Rh Sensitization Caused by Intramuscular Injection of Human Serum.—Wallace and his associates say that it is now generally recognized that transfusions or even intramuscular injections of Rh-positive blood are far more potent in sensitizing Rh-negative persons than is pregnancy with Rh-positive fetuses. Thus, while only 1 of about 25 Rh-negative women bearing Rh-positive babies becomes sensitized to the Rh factor, fully one half of such persons can be sensitized by injections of Rh-positive blood. This difference is readily explained by the difference in quantity of antigen injected. The authors cite a primigravida who is presumed to have been sensitized to the Rh factor by an injection of pooled human serum, given as a prophylactic measure against poliomyelitis during childhood, and in whose baby fatal erythroblastosis developed. They emphasize that the injection of serum or plasma into the Rh-negative women may create Rh sensitization. The hazard of such injections is at times as great as that accompanying the injection of Rh-positive whole blood, and may deprive even primiparas of the opportunity of having normal babies. They urge that in taking obstetric histories careful inquiry be made into whether such injections have been received by the patient. It is likewise recommended that all physicians exercise utmost care and discretion in the use of these substances. Since the preparation of this report, attention has been called by a California physician to a second case of erythroblastosis in a firstborn baby whose mother may have been sensitized by injection of pooled serum as a prophylactic measure against poliomyelitis.

Penicillin or Silver Nitrate Against Ophthalmia Neonatorum.—Berens and Foote point out that practically all states have laws requiring the use of a prophylactic agent in the eyes of the newborn. In most instances the law either leaves to the discretion of the state health department the type of prophylactic agent to be used or specifies "1 per cent silver nitrate or equally effective agent." Recently silver nitrate has been attacked in the press as being ineffective and harmful. The authors show that there is no evidence that permanent damage results from the use of 1 or 2 per cent silver nitrate. Solutions left standing may reach a concentration as high as 50 per cent. For this reason, it has been suggested that silver acetate be substituted, since it appears equally effective but becomes saturated at 1.2 per cent. However, furnishing 1 per

cent silver nitrate in paraffin-lined beeswax ampules, as supplied by most health departments, has overcome danger to the eye from high concentration of the drug. A study by the National Society for the Prevention of Blindness in 1948 showed that there was no damage from silver nitrate among 112,035 live births and that many of the 67 cases of ophthalmia neonatorum occurring among this number were due to infections other than the gonococcus. If it should be established that penicillin or other antibiotic is as good as silver nitrate, it will be some time before the mode of administration, the strength of solution and many other important factors are determined. The authors conclude that no change concerning the use of prophylactic agents in the prevention of ophthalmia neonatorum should be recommended at the present time.

Paper in the Food Industry.—Tanner reviews the sanitary aspects of the use of paper containers for foods and stresses that coliform bacteria are absent in the pulp stream in paper mills and in finished paper. Bacteria are destroyed in paper mills by pulping under pressure with chemicals, bleaching with strong chlorine and passage over drier rolls heated to high temperature. Many species of bacteria die out in paper because of lack of moisture. Only aerobic spore-bearing bacteria survive. A bacterial count such as has been proposed for finished paper is of no value for determining the sanitary quality of paper.

Nikethamide in Barbiturate Poisoning.—Watts and Ruthberg point out that poisoning due to the barbiturates has been increasing, and newspaper publicity, instead of helping the situation, appears actually to have increased the number of cases of attempted suicide from these drugs. An effective antidote to this type of poisoning is therefore of great importance. The authors describe the method used in barbiturate poisoning in the Queens General Hospital, New York City. Certain preliminary procedures were used in all groups, the only variation in the treatment being the choice of nikethamide or picrotoxin. Nikethamide, 5 cc., or lately 10 cc. of 25 per cent nikethamide, is given intravenously, followed by 5 cc. every five minutes for the first hour. In addition, a constant amount was given by intravenous drip so that a base line amount of 5 cc. per hour was administered. After the first hour, booster doses of 5 cc. intravenously were given, on the hour. In cases of more severe poisoning 5 cc. was given every half-hour as a booster. Therapy at first was continued until the patient had a return of reflexes and moved spontaneously, but now it is continued to the point of responding to stimuli such as answering questions. When picrotoxin was used a test dose of 3 mg. was given intravenously. If there was no reaction, 3 mg. was repeated every five minutes for three doses. After a fifteen minute interval another series of three injections at five minute intervals was carried out. Therapy was continued thus until the return of reflexes and spontaneous motion. Between 1941 and 1946, inclusive, 99 cases of barbiturate poisoning were treated. Particular attention is given to the 58 cases treated in 1945 and 1946. Six case histories are presented. The authors found that in no case in which nikethamide failed did picrotoxin succeed in saving the patient. In several cases in which picro-

toxin did not help, nikethamide gave good results. In several cases picrotoxin caused severe convulsions, some requiring the administration of amobarbital (amytal sodium®) for control. In no case did nikethamide cause convulsions. Nikethamide is safer to use for this reason and can be given by nurses without danger, whereas picrotoxin must be given with a physician on hand at all times because of the danger of convulsions.

Traumatic Chylothorax.—Baldrige and Lewis point out that the function of the thoracic duct is the conveyance of chyle and lymph into the general circulation. Chyle flows at the rate of 60 to 190 cc. per hour. With complete severance of the duct it is possible to lose over 4 liters within a twenty-four hour period. Crushing injuries, stab and bullet wounds, fall from height, blow on chest, automobile accidents, severe coughing and surgical accidents are some of the causes of chylothorax. Intrathoracic surgical injury of the thoracic duct resulting in chylothorax is not as rare as might be supposed. The authors know of 1 recent case of traumatic chylothorax following sympathectomy and another as a result of erosion of the thoracic duct from a catheter placed in the chest for drainage of an empyema. Several cases have been observed following resections of the esophagus for tumors of that organ. Adequate removal of certain tumors of the esophagus may require deliberate section of the duct. The importance of appropriate treatment of surgical injuries of the duct cannot be overemphasized. Because of the pinkish gray purulent appearance of the fluid, the unwary observer may be led into the mistaken diagnosis of empyema or hemothorax. The secondary symptoms and frequent fatal termination of chylothorax result from persistent loss of fluid, fat, protein and lymphocytes in cases in which healing does not take place spontaneously or in which successful surgical treatment is not accomplished. Mortality rates from chylothorax approximate 50 per cent. The authors list the aims of treatment of chylothorax and mention the different procedures recommended in the past. Mortality statistics of the past indicate that these measures have not been entirely successful. Repeated thoracentesis and the maintenance of nutrition are essential, but the latter is difficult to achieve. Cure of the condition depends on the establishment of collateral lymph circulation and/or the closure of the injured duct. The authors describe a case of injury of the cisterna chyli during sympathectomy for hypertension, with cure of the resulting chylothorax by ligation of the thoracic duct, the cisterna chyli and all its main afferent trunks. They feel that, in view of the high mortality rates existing in chylothorax, the inadequacy of conservative treatment and the many arguments in favor of surgical ligation, it is difficult to understand the almost universal

condemnation of this procedure. They conclude that ligation of the thoracic duct and/or the cisterna chyli is feasible and may be a life-saving procedure.

Gangrene of Skin.—The patient whose case is reported by Simeone and Hardy had an unusual type of chronic progressive gangrene of the skin of the abdominal wall. Her defense reaction was peculiar in that leukopenia, rather than leukocytosis, accompanied the infection. Recently, Cotter reported 5 patients who showed skin and systemic manifestations which he attributed to the toxic effects of thioglycolic acid in "cold wave" hairdressing solutions. The patient here described was a hairdresser. Her case raises the question of the role that exposure to thioglycolic acid or thioglycolates in "cold wave" solutions may have played in her peculiar susceptibility to infection. While the principal cause of this patient's illness was the infection of the abdominal wall, the nature of the lesion was obscure. It was a granulomatous infection of the skin and subcutaneous tissue causing ulceration of the skin with blister formation and dissolution of epithelium over abdominal scars and in patchy areas over the infected skin. It was suspected that the peculiar hematologic response that this patient exhibited to infection and, in addition, the presence of impaired liver function could be due to an intoxication. Her history was searched for possible exposure to noxious agents. The only possibility was that she might have been exposed to some injurious agents in connection with her work as a hairdresser. The patient submitted for examination samples of all the materials and solutions that she has used in her beauty parlor. None of the solutions tested contained benzene or other known toxic agents except that the cold wave solutions were known to contain thioglycolic acid and/or thioglycolates. The active ingredient in cold wave solutions has already been suspected of exerting toxic effects in man. Hardy has found leukopenia in workers engaged in making cold wave solutions. McCord and his associates with subcutaneous injections of thioglycolic acid produced skin ulcerations which were slow to heal, and they also observed some renal changes and severe damage to the liver. The authors admit that it cannot be stated categorically that the woman whose case is reported owed her peculiar hemolytic response and her liver impairment to thioglycolic acid or thioglycolate intoxication. The evidence is circumstantial. It was thought important to report this case, because with accumulation of data it may be possible to indict or to exonerate cold wave solutions from responsibility.

Relief of Pain in Pancreatitis.—According to Pearson and Lungren the pain in acute pancreatitis is severe and intractable. The most singular characteristic of this disease, pain, is usually sudden in onset, knifelike in character, epigastric in distribution and, in many instances, refractory to narcotics. Prostration and shock are frequent additional factors. Etamon® (tetraethylammonium chloride) has been shown to block effectively sympathetic and parasympathetic impulses at the ganglionic synapse. Inasmuch as both the sympathetic and vagal stimuli excite pancreatic secretion, it would seem reasonable to assume that this drug may be of some benefit in the nonsurgical treatment of acute pancreatitis. The authors cite the case of a woman, aged 32, who presented symptoms of pancreatitis. Intravenous and intramuscular injections of tetraethylammonium chloride counteracted the symptoms and the patient could be discharged several days later. At a follow-up examination several weeks later she was still well.

Weather Conditions and Hemorrhages After Tonsillectomy.—James investigated the relationship between weather change and hemorrhage following tonsillectomy. Among 12,826 tonsillectomies and adenoidectomies performed in a twelve year

period, on children ranging in age from 2 to 12 years, 136 postoperative hemorrhages occurred. These hemorrhages occurred in association with environmental temperature peaks. The change in temperature, not the degree of temperature, is the significant factor. The percentage of postoperative hemorrhages is greater in the colder months when temperature changes are more acute.

Insulin Hypoglycemia and the Ciliary Muscle.—Quinn made retinoscopic examinations on patients receiving insulin hypoglycemia treatment for schizophrenia and other psychoses. Paredrine hydrobromide ophthalmic® (1-[para-hydroxyphenyl]-2-aminopropane hydrobromide) homatropine hydrobromide and atropine sulfate were used to dilate the pupils. Examinations were made before and during the hypoglycemia reaction. Definite stimulation of the ciliary muscle was found in some eyes when paredrine® was used as a mydriatic. This was most pronounced in the youngest group of patients and was greatest during deep insulin hypoglycemia. Homatropine partially abolished the stimulation of the ciliary muscle during insulin hypoglycemia, and atropine almost completely abolished it, especially during deep insulin hypoglycemia. One patient had so strong a stimulation of the sphincter of the iris during the treatment that his pupils could not be dilated with paredrine®, but they could be dilated at other times with paredrine® and could be dilated with homatropine during treatment.

Actinomycosis of Thorax and Abdomen.—In the first of the 6 cases of extensive actinomycosis of the thoracic or abdominal viscera reported by Campbell and Bradford, the disease began with acute appendicitis and progressed to a fatal termination. The clinical course in the second patient was not unlike that in case 1. Though the outcome was little different from that in the previous case, the patient's clinical course appeared to be appreciably altered by the administration of sulfadiazine. The third patient had actinomycosis of the pelvic organs, an extremely rare condition. This patient also died. The fourth patient, who had actinomycosis of the thorax, recovered after surgical drainage and treatment with sulfadiazine and penicillin.

The fifth patient was a man, aged 84, who had an orange-sized mass in the right upper quadrant of the abdomen, which was mildly tender. Later he had acute attacks of abdominal pain. It was felt that his age and general debility precluded a successful surgical procedure. His condition gradually deteriorated, and he died. Necropsy revealed a large chronic abscess and colonies of *Actinomyces* identified by microscopic examination in the wall of the abscess. The case of the sixth patient is noteworthy, because it is believed to be the second one on record in which the patient survived actinomycotic abscess of the liver. Evaluation of chemotherapeutic measures, with particular reference to sulfonamide drugs and penicillin, is difficult, and many years will probably elapse before an accurate appraisal can be made. A definite advance has been made with the addition of sulfonamide drugs and penicillin to the surgical armamentarium.

Endometriosis in General Abdominal Surgery.—Abel is of the opinion that today endometriosis is discovered in roughly half the patients subjected to abdominopelvic operation. This increased incidence results not merely from a more critical evaluation of this disease, but is real. More intrauterine and cervical cautery, with subsequent stenosis, is thought to be an important factor. The symptoms depend to some degree on the distribution of the endometrial changes, but in general can be grouped under the headings of menstrual disorders, pain and infertility. The menstrual disorders are varied, with menorrhagia or hypermenorrhea as perhaps the outstanding ones. Irregularities of flow and even hypomenorrhea are seen. Rectal pain, especially during the menstrual period, is also frequently a part of the story and results from invading rectovaginal implants. With involvement of the ovaries and with the fixation, dyspareunia is occasionally present. Infertility is commonly associated. The cardinal sign of endometriosis is the presence of shotty nodules in the cul-de-sac and rectovaginal septum; this observation of rectovaginal bimanual examination is almost pathognomonic of the disease. The author found that in many instances of endometriosis acute appendicitis was simulated. These cases presented a picture of generalized abdominal pain with localization in some patients. Peritoneal signs were present, apparently the result of irritation from spillage of old grumous bloody material from within the endometriotic lesions. Leukocytosis and fever were usual, and nausea was reported in most instances. The histories of 4 such patients are presented. The lesson the author has learned from such cases is that endometriosis should be kept in mind.

Jaundice and Sulfonamide Drugs.—According to Rammelkamp sulfonamide-induced jaundice may be difficult to differentiate from toxic hepatitis, infectious hepatitis and serum jaundice. Establishment of a definite diagnosis in jaundiced patients is

important because sulfonamide compounds should be discontinued immediately if they are responsible, whereas in jaundice due to other causes sulfonamide drugs may be given. The author differentiates three forms of sulfonamide-induced jaundice, the immediate, intermediate and delayed. In the immediate form of hepatitis secondary to sulfonamide medication jaundice appears one to three days after chemotherapy was started. Prior to this, nausea, vomiting, headache, chills, fever, burning of the eyes and skin rashes may have appeared. As the drug is continued the skin may become icteric and the urine dark with bile. The liver is enlarged and tender and skin rashes appear. An example of this form of hepatitis is reported. Jaundice developed two days after the first dose of a second course of sulfathiazole. In the intermediate form of jaundice the patient becomes critically ill within a few hours, pallor is marked, the liver and spleen may be enlarged and fever is usually present. Hemoglobin may appear in the urine. Later bilirubin and urobilinogenuria are observed. The erythrocyte count and hemoglobin concentration are low, and a smear of the blood may show nucleated erythrocytes. The reticulocyte count becomes elevated. The blood usually contains free hemoglobin as well as increased amount of bilirubin. When toxic reactions occur, the drug must be stopped immediately and blood transfusions should be given. The delayed form of sulfonamide-induced jaundice appears ten or more days after the institution of sulfonamide treatment, at about the time clinical improvement is anticipated. The temperature suddenly increases. Nausea, vomiting, epigastric discomfort, headache, dizziness, photophobia and aching of the joints are other symptoms. A distinctive feature is the appearance of a rash which may be erythematous or exfoliative. Erythema nodosum is not infrequently observed in patients treated with the thiazole derivatives of the sulfonamide drugs. Jaundice develops within a few hours or days after these other toxic symptoms have become manifest.

Normoblasts in the Peripheral Blood in Congestive Heart Failure.—During the past year Groen and Godfried have observed 9 patients with severe congestive heart failure, all of whom showed a varying number of normoblasts in the peripheral blood. In some of these cases there was a temporary remission of the sequelae of the heart failure; during this remission the normoblasts disappeared from the peripheral blood. All of the patients died. Brief case histories of these patients are presented. The authors recommend search for normoblasts in the blood of patients with severe heart failure. When normoblasts are found, interference with the oxygenation of the blood, either by pulmonary infarcts or thrombi inside the heart, is most likely to be present. It seems justifiable to consider the prognosis as very grave in these cases.

Anemia in Hypothyroidism.—Eisenberg believes that hypothyroidism is frequently overlooked in determining the etiology of obscure anemias or those anemias failing to respond to iron and liver therapy. One reason for this is the fact that diminished metabolism may be present without the distinctive clinical features of myxedema. Anemia resulting from hypothyroidism may be of three types. The first type, simple hyperchromic, is the true, uncomplicated anemia of hypothyroidism. The second type is the hypochromic, an iron deficiency anemia modified by the coexistence of hypothyroidism. The third type, the Addisonian hyperchromic, is one of true Addisonian pernicious anemia modified by the coexistence of hypothyroidism. The theory is presented that the effects of the thyroid gland on erythropoiesis are indirect results of changes in the rate of metabolism. A case is cited which is an example of both the first and the second type of anemia resulting from hypothyroidism.

Gastric Ulcer.—Smith and Jordan are concerned with the differentiation between benign and malignant gastric ulcer, pointing out that this problem raises the question whether all patients with gastric ulcers should undergo gastric resection or whether gastroenterologists should continue their attempts to distinguish between those gastric ulcers which can be trusted to be benign and those which are or may become malignant. The authors present observations on 600 cases. The incidence of malignant gastric ulcers was 9.8 per cent. Forty-seven of 59 cases of malignant ulcer were histologically proved and 12, although clinically considered to be malignant, were not operated on for stated reasons. This study does not furnish final data on the controversial point of whether all gastric ulcers should be resected. Many other such studies should be done so that the gastroenterologist and surgeon whose experience is still insufficient may have some guide. The authors found that the male patient is a little more than twice as prone to gastric ulcer as the female, but more than four times as prone to malignant ulcer. The symptoms are disarmingly similar in the cases of benign and malignant ulcer. The greater curvature and fundus have the highest percentages of malignancy, 60 per cent and 50 per cent. Less than one fifth of the prepyloric lesions are malignant, and the same percentage of malignancy is found on the lesser curvature. The greater frequency of ulcers in these regions diminishes the percentile incidence but does not change the fact that the greatest number of malignant lesions are to be found in these areas. No dependence can be placed on the associated roentgen observation of duodenal ulcer with the gastric lesion in the differentiation of benign and malignant ulcer; in this series, a roentgenologic defect of the duodenum was diagnosed in 31 per cent of those gastric ulcers which were proved malignant. Since recurrent gastric ulcer harbors potential malignancy, a recurrence is an indication for resection, although this policy will result in the resection of many benign ulcers. The first occurrence of gastric ulcer must be treated with persistence. Failure of complete healing within six to eight weeks and all recurrences are justification for resection.

Infectious Mononucleosis and Infectious Hepatitis.—Berk and his associates say that clinical similarities between infectious hepatitis and infectious mononucleosis have long been appreciated. Jaundice has been observed repeatedly in patients considered to have infectious mononucleosis. Interest was aroused by hematologic changes suggestive of infectious mononucleosis noted surprisingly often by one of the authors in soldiers with virus hepatitis. They made serial observations of the behavior of the heterophile antibodies in patients with infectious hepatitis. Similar observations were begun on patients with infectious mononucleosis. Significant increases in heterophile antibody titer were found to occur rarely in infectious

Venous Obstruction in Upper Extremity.—Hughes points out that Paget in 1875 and Schrotter in 1884 described a condition wherein an arm of an otherwise perfectly healthy person became diffusely swollen and discolored. Schrotter believed that movements of the shoulder girdle damaged the axillary vein and were thus responsible for the formation of a thrombus. Although many have accepted this theory, neither trauma nor thrombosis is a constant feature. Hughes presents histories of 5 patients with this disorder and says that the prognosis, as far as life is concerned, is excellent, but residual after-effects, varying in degree from trivial to serious, persist probably in all cases, suggesting that obstruction is permanent with recovery dependent on the efficiency of the collateral vessels. Most explanations so far given for this condition suggest a thrombus in the axillary or subclavian vein, but operation frequently reveals no sign of a thrombus. The author describes investigations that have been made on the causation of this condition. The research indicates that the phrenic nerve which passes anterior to the subclavian vein, a pre-venous phrenic nerve, may constrict the vessel against scalenus anterior the tendon, as effectively as a ligature. Anticoagulants should be administered as soon as possible to limit the extent of intravascular clotting which may follow secondarily and which may obstruct vessels concerned in establishing a collateral circulation. Paravertebral sympathetic blocks have shortened the convalescence, probably by their influence on the collateral vessels.

Subphrenic Abscess.—Hunt presents observations on 12 cases of subphrenic abscess that came under his observation during the past sixteen months. In 3 of these the subphrenic abscess developed after operations which the author himself had done; in the other cases the original cause, such as appendicitis or perforated peptic ulcer, had been treated at other hospitals. The author stresses that subphrenic abscess may follow inflammation in almost any intra-abdominal organ. Early and efficient treatment of any predisposing cause, such as appendicitis or peptic ulcer, will prevent it. The controversy over Fowler's position and the theories of the spread of infection from below upward by the lymphatics and capillary attraction make it difficult to decide on the best methods of prevention. Fowler's position is difficult to maintain and tends to restrict the breathing, but on occasion it affords the best method of getting dependent drainage. In a diffuse inflammation it is unlikely that a drainage tube will drain anything beyond its immediate track after the first forty-eight hours and should therefore be removed. When the inflammation is well localized the tube will continue to function as long as there is anything to drain or until the abscess walls collapse and the abscess cavity becomes obliterated. It is in such cases that Fowler's position may be employed with advantage. As a rule, a subphrenic abscess needs drainage as soon as a diagnosis is made. Diagnostic needling should be avoided, because there is danger of spreading the

infection to pleura or peritoneum or of damaging some intra-abdominal organ. The longer a subphrenic abscess remains untreated the more likely it is that chest complications will follow and the chances of recovery diminish. The extraperitoneal approach should always be employed. An anterior subcostal or paramedian incision is suitable for the anterior spaces and resection of the twelfth rib for the posterior spaces and the right inferior space. Great care is needed to avoid injury to the splenic flexure in left-sided cases. Many different kinds of organisms may be present. Massive doses of penicillin supplemented by sulfonamide compounds are beneficial. A high protein diet, breathing exercises from the start and careful nursing all help to hasten recovery.

British Medical Journal, London

2:1049-1090 (Dec. 18) 1948

 Steroid Metabolism and Frontal Lobes. F. Reitman.—p. 1064.

Vitamin D in Boeck's Sarcoidosis.—Robertson reports a case of Boeck's sarcoidosis in which the skin lesions had been slowly progressing for nine years and in which sudden spontaneous improvement was not expected. The administration of calciferol in the form of tablets resulted in dramatic improvement of the skin lesions. The main improvement occurred during a three week period of severe toxic effects unrelated to the level of serum calcium. The author points out that there is evidence that sarcoidosis is related to or identical with tuberculosis. The response of the skin lesions of sarcoidosis to treatment with calciferol resembles that of lupus vulgaris, this being another point in favor of a close relationship between sarcoidosis and tuberculosis. Robertson believes that in view of the risks of causing a sarcoid lesion to flare up elsewhere and of causing sudden extension and ulceration of the skin lesions, calciferol should not be used in the treatment of sarcoidosis unless the lesions are extensive and disfiguring.

Aortic Coarctation with Patent Ductus Arteriosus.—Haxton and Thomson say that although coarctation of the aorta and patent ductus arteriosus are now recognized as defects which are amenable to surgical treatment, the opportunity seldom arises of treating them simultaneously. They present the history of a girl in whom the diagnosis of congenital heart disease had been made at the age of 2 years and 4 months, but the precise defect was not determined at that time. At the age of 7 she presented typical signs of aortic coarctation, and an operation was performed. The mediastinal pleura was incised and reflected to expose the main arteries and the vagus nerve. An aortic coarctation, marked by a narrowing of the exterior and by a palpable thickening of the wall, was found 1 cm. beyond the left subclavian artery, and a small patent ductus, suspected clinically, was attached to the aorta near the level of the coarctation. The coarctation was resected and found to be almost complete. The opening of the ductus was immediately distal to the coarctation. The ends of the aorta were anastomosed by two stay stitches and a single running suture of black silk on an eyeless needle. The suture passed through all coats and an endeavor was made to get square apposition of the cut ends of the vessel. The child is now lively and healthy looking. The early appearance of a well developed collateral circulation indicated a severe degree of coarctation, and the ultimate prognosis with operation was regarded as poor. The right axis deviation seen in this case is noteworthy, because aortic coarctation is usually accompanied by a left axis deviation. It has been suggested by Gilchrist that this may be due to the presence of a patent ductus arteriosus opening distal to the coarctation. In these circumstances the blood is believed to flow from the pulmonary artery to the aorta, thus throwing an additional load on the right ventricle. This case supports Gilchrist's theory, but the small caliber of the duct and the persistence of the right axis deviation eleven months after operation suggest that this is not the full explanation.

Relapse of Pernicious Anemia During Folic Acid Therapy.—Mollin believes that the danger of the development of subacute combined degeneration of the cord in patients treated with folic acid makes it unlikely that many long term studies will be made of its ability to maintain the hematologic remissions it produces. He presents the history of a patient who relapsed under treatment with folic acid. The average levels of red cells and hemoglobin during the period of successful folic acid therapy were slightly lower than those reached later on liver therapy. The amount of folic acid required to induce the initial remission was small, and the patient was kept in excellent health for eight and a half months on the maintenance doses given. The fall in red cell count began after the patient had been receiving folic acid 5 mg. daily for about four months. This trend could not be reversed by a fourfold increase in the dose of folic acid. Larger doses might possibly have been effective, but it did not seem justifiable to withhold liver extract any longer. The patient responded well to liver extract.

Isolation of Lepers.—Simons quotes Rogers and Muir as saying, "As long as we had no treatment of material value there was some excuse for recourse to the crudities of the Middle Ages, the lifelong segregation of lepers." Today, however, one can save energy and money by isolating only the malignant lepromatous and not the hansenide patients. The hansenide patients who leave leper colonies will in their turn encourage others to undergo adequate treatment, since they will see by this example that leprosy is no longer a crime which is punished by imprisonment for life, but that it is curable and certainly in two thirds of all cases not even contagious. Lepers and sufferers from disease classified as leprosy will no longer fly from the police and the doctor. The answer to the question what should be done with the isolated patients is twofold. 1. All patients with infectious leprosy should remain in isolation. Leper homes should be called "clinics" or some such name. Reactions should be negative for at least two years without the appearance of new symptoms before the patient's discharge is considered, as any shorter interval has resulted in too many relapses. 2. All hansenide patients (N or nodular leprosy) should be discharged immediately, though they would have to

remain under regular supervision of a skin specialist. The following should be cared for by the public health authorities: Those hansenide patients who suffer from general poor health, or who return to unhealthy and poor environment; also patients who are likely to turn to prostitution or to contract tuberculosis—24 per cent to 32 per cent of all lepers die from tuberculosis and many more suffer from it. Segregation should depend not on the diagnosis of leprosy, but on the differential diagnosis between infectious malignant leprosy and the noninfectious hansenide.

Two Complications in Use of Miller-Abbott Tube.—

Wilkie reports that two complications of the use of the Miller-Abbott tube not previously reported were recently observed in the same patient. The first complication, occlusion of the lumen of the tube, was produced by shrinking of the thread used to lash the balloon to the tube and was due to failure to wet the thread before use. The result was that after the tube had been introduced the balloon could neither be inflated nor deflated. The balloon contained only about 10 cc. of air, but had the balloon been fully inflated, it would probably not have been possible to remove the tube by any means other than an operation. The second complication was that it was impossible to withdraw the tube. Roentgen investigation showed that the balloon was constantly arrested at the duodenojejunal flexure. In the course of five days many attempts to withdraw the tube failed. Finally the tube was cut at the patient's mouth in order that the distal end and the balloon might eventually be passed per rectum. During the next three days roentgenoscopy revealed that the tube progressed, but the patient had intermittent attacks of cramps and vomiting. These were relieved by morphine. The tube was passed on the third day and the cause of the trouble was then obvious. The house surgeon, in lashing the balloon to the tube, had not trimmed away the excess of balloon material, so that it formed a projection around the proximal lashing of sufficient size to be gripped by the bowel in spasm.

Pregnancy and Multiple Sclerosis.—Hirschmann points out that there have been cases in which a supervening pregnancy has caused no change whatsoever in existing multiple sclerosis; in other cases, however, pregnancy has been known to cause serious exacerbations. Recent observers have gained the impression that if pregnancy occurs during a chronic progressive form of multiple sclerosis, there is nearly always an exacerbation. The effect of pregnancy in the numerous cases of multiple sclerosis that have an intermittent course remains unclarified. The author investigated the records on multiple sclerosis of the neurologic clinic of the University of Tübingen and found that age is an important factor; that is, the higher the age at which multiple sclerosis and gestation concur the more unfavorable is the prognosis. The critical point seemed to be the transition of the third to the fourth decade. Of 42 women in whom onset or exacerbation of multiple sclerosis concurred with pregnancy or delivery, only 9 were in the third decade of life and the

other 33 were in the fourth decade. In answer to the question whether an interruption of pregnancy might prevent the progression of the multiple sclerosis, the author says that this could be considered in only some of the cases, for the exacerbation frequently appears during the second half of pregnancy, at a time when interruption is too dangerous.

In Vitro Culture of Endocrine Glands for Reimplantation Into Human Organism.—Bauer discusses the possibility of utilizing endocrine tissue cultures in the treatment of hormonal deficiencies. He attempts to show what may be regarded as possible and what is not possible as yet. The aim is to supply the human organism with hormone-producing cells instead of with chemical hormones. The author mentions three different culture methods that will be suitable for reimplantation into the human organism. Cultures of testes of calves were used in self experiments by the author in order to test local and general reactions. The site of injection remained slightly swollen and sensitive to pressure for a few days, but then these phenomena subsided. For pancreatic cultures material was obtained from a human fetus and in vitro cultures of several days were injected under the fascia lata of the thigh in a patient with diabetes mellitus. The injection was immediately effective, the blood sugar decreased and the patient, who previously had required 20 units of insulin daily, now feels well without insulin. The author admits that 1 case is not sufficient to demonstrate the efficacy of a method. It is possible that much larger doses should be given. The administration of the cultures is without danger. Discussing the possible mode of action of this method, the author considers (1) the hormones contained in the fragment, (2) the living cells of the matrix of the explantation and (3) the living cells of the growth zone. He stresses that after the injection of cultures of endocrine tissue a much larger biologically active surface is created. The third method of culture mentioned, the explanation of complete endocrine glands, is still in its beginnings and according to Bauer's observations is not suitable for all endocrines. The best results are obtained with thyroids, gonads and organs having a large amount of smooth muscle. Tissue cultures have been administered intramuscularly in more than 50 cases. In the majority of the cases there was a subjective improvement.

Streptomycin and Surgery of Pulmonary Tuberculosis. M. Bérard and P. Juttin.—p. 885.

Streptomycin Treatment for Tuberculosis.—Dufourt and Despeignes treated 120 tuberculous patients with streptomycin. The total dose of the drug varied from 60 to 120 Gm. Of 11 patients with miliary tuberculosis, 6 were cured, 2 recovered temporarily but later died of meningitis in spite of roentgenographic improvement; 1 showed considerable and 1 fair improvement, and 1 was a failure. Of 4 patients with bronchopneumonia, 1 was cured, 2 showed considerable and 1 fair improvement. Of 13 patients with diffuse infiltrations, 1 was cured, 6 showed considerable and 4 fair improvement and 2 were failures. Of 47 patients with limited infiltrations, 11 were cured, 10 were considerably improved, 14 slightly improved and 12 were failures. Of 45 patients with cavities, 10 were cured, 10 others showed considerable and 14 showed fair improvement and 11 were failures. Streptomycin exerts a remarkable effect in cases of miliary tuberculosis and in recent acute cases of congestive type.

Definite improvement may result in fresh pneumonic processes and in beginning infiltrations. Good results may be obtained in diffuse bronchopneumonic forms which are not yet far advanced. Results vary from patient to patient in cases of chronic fibrocaseous tuberculosis. Usually the effect of streptomycin is only a relative one and may be exhausted before complete return to health. The volume of some cavities may be diminished, and some may disappear completely. It is likely that the collapse of the cavities depends primarily on the effect on the lesions of the draining bronchi. The streptomycin is effective in tuberculosis of the bronchi as well as in that of the larynx. This antibiotic makes it possible that a large number of tuberculous patients may be benefited by thoracic surgical treatment who otherwise would not because of the gravity and the extent of their lesions.

Eclampsia During Second World War.—Mastboom presents the results of an investigation on the incidence of eclampsia and other toxemias of pregnancy during the second world war in Amsterdam. A definite reduction was observed in all forms of toxemias of pregnancy. The author evaluates various factors which may be responsible for this decreased incidence and suggests that it is chiefly due to deficient nutrition which reduced the tonus in the vascular wall and caused a general lowering of the blood pressure. This loss of tonus increases the reserve of circulation. Lack of this reserve involves an insufficient blood irrigation of the intervillous spaces, which is the probable basis for the development of the toxemias of pregnancy.

Anhidrosis After Treatment with Neosarsphenamine.—Blom-Ides and Polano report 2 patients who experienced considerable discomfort when they were exposed to high temperatures. It was found that they had anhidrosis over the major part of their skin. In one of these patients a lichenoid neosarsphenamine exanthem had preceded; in the other, a Negro, an exfoliative neosarsphenamine erythrodermia, which had caused an extensive depigmentation. The authors point out that these cases recall Sulzberger's report on tropical anhidrotic asthenia following lichenoid dermatitis caused by treatment with quina-crine.

Experiences with Folic Acid.—Waldenström and Andér found that folic acid treatment of 25 patients with pernicious anemia gave satisfactory hematologic effect in all cases. The results in the 10 patients treated earlier with liver were comparable to those attained by liver treatment. The formation of erythrocytes was perhaps slightly slower with the folic acid dosage applied, which was kept as low as possible. Three cases of megaloblastic anemia refractory to liver responded to treatment with folic acid; in 1 case the effect of massive doses of folic acid lasted for almost two years. Otherwise no storage of folic acid with durable effect occurred. Observation on 15 patients controlled for five months or more seemed to indicate that treatment with folic acid protects against the development of neurologic symptoms but does not affect neurologic symptoms already present. In 1 instance, with neurologic symptoms developed on admission, initial improvement of the symptoms on administration of folic acid gave way to progression of the symptoms, and liver treatment was instituted. Treatment with folic acid alone is not advisable in patients with neurologic complications, and careful control of the nervous system is

imperative in continued treatment with folic acid. The authors query whether the low incidence of neurologic complications in their cases depends on the low folic acid dosage applied or on a low incidence of such complications in their Uppsala cases. A special field for treatment with folic acid is in patients with aggravated hypersensitivity to liver extract.

Clinical Significance of Right Axis Deviation in Electrocardiogram.—Ørning says that examination of the electrocardiograms of 7,700 patients revealed right axis deviation in 245. In patients with heart disease it appeared most often in mitral stenosis, 60 cases, and in congenital heart disease, 9 cases. In mitral stenosis it was greater in the patients with auricular fibrillation and in those with decompensation. Right axis deviation increases if the heart disease is intractable and tends to increase with the duration of the mitral stenosis, is somewhat more pronounced in cyanotic than in noncyanotic patients in congenital heart disease and is less marked in cases of hypertension than in cases of mitral stenosis. Right axis deviation in the electrocardiogram of patients with various pulmonary diseases appeared more often in cases of chronic disease and was rare in acute pulmonary disease; of the 28 patients with pulmonary disorders 13 had chronic bronchitis. Fifty patients with right axis deviation had gastrointestinal disorders, especially peptic ulcers. Twenty-three patients with right axis deviation, of whom 19 were under 40, had various internal diseases.

Colon Bacillus Theory of Appendicitis.—Kauffmann considers the frequent presence of certain serologic colon bacillus type with K antigens in the normal appendix as an important predisposing factor for appendicitis. The causative agent is on the spot, able at any time to assert its pathogenic faculties as soon as any disorder or injury happens to the mucous membrane of the appendix. Whether or not necrotizing appendicitis develops may largely depend on the presence or absence of necrotizing *Escherichia coli* strains in the appendix. This may be compared with the significance of certain pneumococcal types to the course of an attack of pneumonia. One knows just as little about the reason why under the given circumstances pneumonia develops in certain persons, as why appendicitis starts. The same *Esch. coli* types as observed in appendicitis may also be obtained in cultures from peritoneal pus in cases of appendicitic peritonitis in the same patients. The same types are encountered also in infections of the urinary tract and bile ducts, and their etiologic part here cannot be denied. Hence to designate certain serologic *Esch. coli* types as particularly pathogenic seems justified. They do not always induce infection. In this respect they are not on the same level as highly pathogenic micro-organisms such as plague bacillus and *Vibrio comma*; they merely possess a conditional pathogenicity. The clinical aspect of acute appendicitis, a true infectious disease, may be explained easily as an infection with certain serologic types of the *Esch. coli* group. In some cases the possibility of a mixed infection with certain serologic types of enterococci or other bacteria may be taken into account.

- *Hematogenous Tuberculosis: Prognosis. A. P. Heudtlass and A. J. Tassara.—p. 1075.
*Streptomycin in Treatment of Whooping Cough and Complications. J. M. Albores.—p. 1082.

Prognosis of Hematogenous Tuberculosis.—According to Heudtlass and Tassara the factors which have an influence on the prognosis of hematogenous tuberculosis are the virulence and number of tubercle bacilli, and the natural resistance and

the immunobiologic and economicosocial condition of the patient. The character of the lesion depends on these factors. An early etiopathogenic diagnosis and continued prolonged observation of the patient with clinical, roentgen and laboratory examinations are important. General hematogenous tuberculosis with involvement of all viscera is acute, and almost always fatal. The prognosis is favorable in types of prolonged, slow evolution, except when these types, through the presence of certain determining factors run in successive bouts to either a tertiary form or into a rapidly acute form and death. The response of the patient to the treatment is a reliable prognostic index, especially in types with local foci and in hematogenous cavitation. The classic treatment should be resorted to. Streptomycin is still in the experimental phase in man. In making a prognosis it is advisable to evaluate the fact that the sequels of an early dissemination, the prognosis of which is favorable, can be complicated by superimposed lesions of a new hematogenic focus. Patients with secondary lesions of primary infection should be isolated from the source of contagion and should be protected against factors which favor an unfavorable prognosis. Early diagnosis and serial and prolonged observation of the patient are of great value.

Streptomycin in Whooping Cough.—Albores reviews the literature and comments on the value of early administration of streptomycin. The drug is administered by the intramuscular route. The daily dose for infants and children, respectively, varies from 0.50 Gm. for the former to 1 Gm. for the latter. This dose is administered in either four or six fractional doses which are administered at regular intervals. The treatment is given for five or ten consecutive days. Streptomycin nebulizations are given in the course of the intramuscular treatment in acute forms. The author concludes that the drug is indicated in the following cases: (1) in infants less than 1 year of age; (2) in acute forms complicated with dyspnea, cyanosis or nervous and pulmonary symptoms and (3) as a preventive measure. In such cases the drug is given in nebulized form to infants and children who are living in an epidemic environment and who begin to cough.

- *Symptomatology of Traumatic Diaphragmatic Hernia. H. E. Stocker.—p. 545.
Pathogenesis of Malignant Neoplasms. H. Flamm.—p. 547.
Tasks of Social Worker in Psychiatry; Part Played by Mental Deficiency in State of Neglect. A. Juda.—p. 549.
Continuous Spinal Anesthesia. H. Karnitschnigg.—p. 552.

Traumatic Diaphragmatic Hernia.—Stocker reports 4 cases of traumatic herniation in 4 men between the ages of 22 and 54. In 1 patient the herniation resulted from blunt trauma occurring from a fall against the edge of a table, while in the 3 other patients it resulted from penetrating gunshot wounds. These 4 cases revealed that rupture of the diaphragm may be manifested months or even years after the original trauma. Rupture may be the result of a slight subcutaneous injury of the diaphragm, which first could not be demonstrated. Fibrous healing of the wound of the diaphragm presents a spot of lessened resistance where a tear may result from a relatively slight trauma or even from exertion because resistance can no longer be offered to an increased burden. These are the premises for the occurrence of acute symptoms of herniation through the diaphragm, which in the author's cases were manifested two and a half months to eleven months after the original trauma, and in 2 of them after a forced march for several hours. Escape of abdominal viscera into the thorax with prolapse of the spleen occurred in 2 of the cases of percutaneous rupture of the diaphragm. In one, death occurred eight days after surgical intervention in which the adhesions between the spleen and the internal thoracic wall were loosened and the spleen returned to its normal position, while fatal peritonitis resulted from spread of an infection with streptococci. In the other case the prolapsed spleen was left in the thoracic cavity; the patient recovered and there were no harmful sequelae.
